1. Introduction

This Sediment Quality Triad and Porewater Data Report (report) presents the results from the sediment quality triad (SQT) and porewater sampling program conducted in the Newark Bay Study Area (NBSA; Figures 1-1 and 1-2) in September 2015. The SQT and porewater program was conducted in support of the baseline human health and ecological risk assessment (BHHERA) and in accordance with the Sediment Quality Triad and Porewater Sampling and Analysis Quality Assurance Project Plan (SQT QAPP; Tierra Solutions, Inc. (Tierra) 2015), as approved by the U.S. Environmental Protection Agency (USEPA) on September 3, 2015. Pursuant to the Administrative Order on Consent under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA Index 02-2004-2010; USEPA 2004), Glenn Springs Holdings, Inc. (GSH) is conducting a Remedial Investigation/Feasibility Study, on behalf of Occidental Chemical Corporation (the successor to Diamond Shamrock Chemicals Company [formerly known as Diamond Alkali Company]), for the NBSA.

The SQT QAPP (Tierra 2015) field program involved collecting sediment samples for the following analyses:

- Sediment chemistry for constituents of potential concern and constituents of potential ecological concern (COPECs) that include a suite of organic and inorganic analytes.
- Sediment toxicity testing in a laboratory using surface sediment collected during the SQT QAPP field program and laboratory-supplied standard amphipod test species, *Leptocheirus plumulosus*. Survival and growth were measured in the toxicity tests.
- Benthic invertebrate community analyses using surface sediment collected during the SQT QAPP field program. Specimens were identified and counted from bulk surface sediment samples.
- Sediment bioaccumulation testing in a laboratory using surface sediment collected during the SQT QAPP field program and laboratory-supplied polychaete test species, *Nereis virens*. Tissue samples of the polychaete were analyzed for COPECs.
- Porewater chemistry collected from surface sediment using passive samplers in the laboratory (i.e., *ex-situ*). Porewater samples were analyzed directly for inorganic COPECs and other select constituents (metals, methyl mercury, ammonia, and total sulfide, and dissolved organic carbon), and indirectly using passive samplers for a select group of organic COPECs for which porewater/passive sampler partitioning coefficients have been experimentally determined and reported in the literature. These include polychlorinated biphenyls (PCBs), polycyclic aromatic hydrocarbons (PAHs), pesticides, and polychlorinated dibenzo-*p*-dioxins/polychlorinated dibenzofurans (PCDDs/PCDFs).

1.1 Purpose

The data collected during the SQT QAPP field program will be used in the BHHERA for the following purposes:

1. SQT data support the baseline ecological risk assessment (BERA). The SQT assessment is an effects-based, weight-of-evidence approach used to evaluate risks to benthic invertebrate communities using three primary lines of evidence: 1) sediment chemistry, 2) sediment toxicity, and 3) benthic invertebrate community metrics. The SQT method incorporates a combination of both quantitative and qualitative analyses to identify potential cause-and-effect relationships between two or more of the components. The approach provides information needed for the BERA to identify degraded conditions and assess impacts of pollution-induced effects on benthic invertebrates.
2. Bioaccumulation data and porewater chemistry data provide additional lines of evidence to support the BERA.
3. Surface sediment chemistry analyses in shoreline (i.e., potential access) areas of the NBSA support the baseline human health risk assessment (BHHR).

This report documents the results of these investigations.

1.2 Document Overview

Section 1 of this report presents the introduction, Section 2 presents the sampling design and methodology, and Section 3 presents the results. References are provided in Section 4. The following appendices provide supporting documentation for this report:

- Appendix A – Newark Bay Study Area Ecotoxicological Evaluation of Sediments for Toxicity and Bioaccumulation Testing
- Appendix B – Summary on the Calculation of Porewater Concentrations of Organic Compounds from Passive Samplers
- Appendix C – Newark Bay Study Area Benthic Macroinvertebrate Sample Analysis
- Appendix D – Newark Bay Study Area Benthic Macroinvertebrate Sample Biomass
- Appendix E – Summary Tables of Chemistry Analysis Results
- Appendix F – Laboratory Data Reports (on USB drive)
- Appendix G – Data Verification/Validation Reports (on USB drive)
- Appendix H – Data Quality Usability Assessment Report
- Appendix I – Benthic Index of Biotic Integrity Threshold Values

2. Sampling Design and Methodology

This section summarizes the sampling design and methodology used during the September 2015 SQT and porewater sampling program. Detailed descriptions of the sampling design and methodology are presented in the SQT QAPP (Tierra 2015). Section 2.1 identifies the locations sampled during the SQT and porewater sampling program. Methods used to collect and process the samples are summarized in Sections 2.2 and 2.3, respectively. The NBSA Sediment Quality Triad and Porewater Field Report ([SQT Field Report]; GSH 2017) contains complete documentation of field activities, including deviations from the SQT QAPP.

2.1 Sampling Locations

Sediment grab samples were collected from 43 stations over 13 days (September 13 to 17, 2015, September 20 to 24, 2015, and September 28 to 30, 2015). SQT analyses (sediment chemistry, toxicity testing, and benthic invertebrate community analysis) and porewater chemistry analyses were conducted at 30 of these stations. The remaining 13 stations were only analyzed for sediment chemistry to support the BHHRA. Bioaccumulation tests were conducted at a subset of eight stations. Table 2-1 provides the list of sampling stations with coordinates, and Figure 2-1 presents the sediment station locations. Table 2-2 provides a summary of the sampling stations, sediment collection dates, sample processing dates, and identifies the analyses conducted on samples from each station. Also included in Table 2-2 are details regarding field duplicate samples and matrix spike/matrix spike duplicate samples collected.

In addition to the sediment grab samples, approximately 70 gallons of surface water were collected from one location in northern Newark Bay for use in the *ex-situ* porewater passive sampling study. Approximately 20 gallons of surface water was collected on September 13, 2015, approximately 20 gallons was collected on September 14, 2015, and approximately 30 gallons was collected on September 28, 2015. The surface water collection location is shown on Figure 2-1.

Additional details regarding sediment sampling and surface water collection activities are included in the SQT Field Report (GSH 2017).

2.2 Sampling Methods

Surface sediment and benthic invertebrate community samples were collected using grab sampling techniques, and surface water was collected using a peristaltic pump. Additional details regarding sediment sample collection activities are included in the SQT Field Report (GSH 2017).

2.3 Sample Handling and Processing

2.3.1 Sediment Chemistry

Sediment samples were processed at the temporary laboratory facility set up at 80 Lister Avenue in Newark, New Jersey. As shown on Table 2-2, sediment was processed over 13 days (September 14 to 18, 2015,

September 21 to 25, 2015, and September 29 to October 1, 2015) at the Lister Avenue facility in accordance with the SQT QAPP (Tierra 2015). Sediment collected from each sampling location was processed the day after collection. Details regarding sample processing are included in the SQT Field Report (GSH 2017).

2.3.2 Bioaccumulation Study

A 28-day laboratory bioaccumulation study was conducted by EA Engineering, Science, and Technology, Inc. (EA) of Hunt Valley, Maryland on NBSA sediment from October 22, 2015 through November 19, 2015 to provide data on the direct uptake of various chemical contaminants by a representative invertebrate organism that lives in the sediments of the NBSA, the polychaete worm *N. virens*. Test chambers were prepared using sediment from the eight bioaccumulation sampling stations identified in Table 2-2; artificial seawater was used as the overlying water in each test chamber. After a 7-day stabilization period, adult polychaete worms were loaded into each test chamber for a 28-day exposure period. During the 28-day exposure period, observations of mortality and abnormal organism behavior were recorded daily, and dead organisms, when observed, were removed. Measurements of temperature, pH, dissolved oxygen, and salinity of the overlying water were recorded at test initiation, termination, and three times per week. Organisms were not fed during the exposure period. After 28 days of exposure, the organisms were recovered from the test chambers and placed into clean artificial sea water for 24 hours to purge their digestive tracts. Tissue samples of the polychaete worms were then prepared and submitted for analytical chemistry analysis. Additional details regarding the bioaccumulation study are provided in Appendix A.

2.3.3 Ex-Situ Porewater Passive Sampler Study

The University of Maryland Baltimore County conducted an *ex-situ* (i.e., laboratory) porewater passive sampler study from September 23, 2016 through November 6, 2015 on the sediment samples collected from the 30 SQT stations identified in Table 2-2 to measure concentrations of a subset of COPECs in sediment porewater from the NBSA. Hydrophobic organic compounds were measured using polyethylene (PE; PCB congeners, pesticides, and semivolatile organic compounds via select ion monitoring [SVOC SIM]) and polyoxymethylene (POM; PCDDs/PCDFs) passive samplers. Dialysis (i.e., diffusion) samplers were used to measure metals and other inorganics (i.e., mercury, methylmercury, dissolved organic carbon, ammonia, and total sulfide). These sampling procedures are discussed further below.

2.3.3.1 Hydrophobic Organic Compounds

As described in the SQT QAPP (Tierra 2015), passive equilibrium sampling for hydrophobic organic compounds (PCDDs/PCDFs, PCB congeners, pesticides, and SVOC SIM) was conducted by placing PE and POM passive samplers in test chambers containing site sediment and site water and allowing the sediment slurry to mix via tumbling for 30 days. Before contact with the sediment slurry, each passive sampler was cleaned. Passive samplers for analysis of PCB congeners and SVOC SIM were impregnated with a set of performance reference compounds that allow the assessment of the extent of equilibrium achieved during the contact period. After the period of contact, the passive samplers were removed from the sediment slurry and cleaned to remove any attached sediment particles. The passive samplers were placed

into laboratory-supplied sample bottles and placed on ice in a cooler for shipment to the analytical laboratory for extraction and analysis.

The analytical laboratories reported the concentrations of organic compounds in the extract from the passive samplers, which were then corrected using site-specific partition coefficients. Passive sampler partition coefficients were used, as described in Ghosh et al. (2014), to calculate the aqueous concentration in equilibrium with the sediment. Site-specific partition coefficients for the compounds were then calculated by dividing the sediment-phase concentration by the equilibrium aqueous-phase concentration. Because some of the strongly hydrophobic compounds did not achieve equilibrium during the period of contact due to slow mass transfer, a mathematical correction using performance reference compounds was performed to calculate the true equilibrium concentrations (Fernandez et al. 2009).

Porewater concentrations of all pesticides were measured using PE passive sampling. For some pesticides (i.e., DDx), partition coefficients are available in the literature (e.g., Fernandez et al. 2014) and were used to estimate the freely dissolved porewater concentrations. For the remaining pesticides, for which polymer partition coefficients (K_{pe}) are not available, the freely dissolved porewater concentrations were estimated based on a correlation between the known pesticide partitioning coefficient and compound log K_{ow} . Performance reference compounds used for PCBs were also used for corrections of non-equilibrium for all pesticides.

A memorandum summarizing the methodology used to calculate porewater concentrations of organic compounds based on the *ex-situ* exposure of the PE and POM passive samplers is provided in Appendix B. The risk assessment will address the uncertainty associated with the porewater concentrations.

2.3.3.2 Metals and Other Inorganics

Dialysis samplers were used for the sampling of metals and other inorganics (mercury, methylmercury, dissolved organic carbon, ammonia, and total sulfide) in porewater. *Ex-situ* laboratory equilibrium studies were conducted in 5-gallon buckets (one bucket for each sampling location). After the buckets were allowed to reconsolidate in the laboratory for 2 weeks, dialysis samplers containing deionized water with matching site salinity were placed in each bucket. Multiple dialysis devices were placed within the top 12 inches of sediment in each bucket to allow the final collection of 1.5 liters (L) of dialyzed porewater. The dialysis samplers were allowed to equilibrate in the sediments for a period of 2 weeks. After removal, the water sample within the dialysis chambers was emptied into analytical laboratory-supplied sample bottles without headspace and placed on ice in a cooler for shipment to the analytical laboratory.

2.3.4 Toxicity Testing

EA conducted two toxicity tests on the sediment samples collected from the 30 SQT stations using *Leptocheirus plumulosus*: a short-term 10-day exposure for survival and a longer-term 28-day exposure for survival, growth, and reproduction. The 10-day toxicity test was conducted using USEPA (1994) *Methods for Assessing the Toxicity of Sediment-associated Contaminants with Estuarine and Marine Amphipods*

(EPA/600/R-94/025) and ASTM International (2008) *Standard Guide for Measuring the Toxicity of Sediment-Associated Contaminants with Marine and Estuarine Amphipods* (E-1267-03). The 28-day toxicity study was conducted using USEPA (2001) *Methods for Assessing the Chronic Toxicity of Marine and Estuarine Sediment-associated Contaminants with the Amphipod, *Leptocheirus plumulosus** (EPA/600/R-01/0250).

The 10-day toxicity test was conducted from October 30, 2015 through November 9, 2015. Test chambers were prepared using sediment from the 30 SQT sampling stations identified in Table 2-2; artificial seawater was used as the overlying water in each test chamber. After a 7-day stabilization period, test organisms (*Leptocheirus plumulosus*) were loaded into each test chamber for a 10-day exposure period. During the 10-day exposure period, the test chambers were not aerated and the test organisms were not fed. The test chambers were visually inspected daily for abnormal organism behavior or lack of burrowing, and water quality measurements of temperature, pH, dissolved oxygen, oxidation-reduction potential (ORP), and salinity were recorded daily. At the end of the 10-day exposure period, the test organisms were retrieved from the test chambers and the number of live organisms in each chamber was recorded. The 10-day mean percent survival was then calculated.

The 28-day toxicity test was conducted from October 22, 2015 through November 19, 2015; however, due to unacceptable control mortality (25%), the test was considered invalid and was re-run. Additional details regarding the initial invalid test can be found in Appendix A. A second, successful test was conducted from November 25, 2015 through December 23, 2015. Test chambers were prepared using sediment from the 30 SQT sampling stations identified in Table 2-2; artificial seawater was used as the overlying water in each test chamber. After a 7-day stabilization period, test organisms (*Leptocheirus plumulosus*) were loaded into each test chamber for a 28-day exposure period. During the 28-day exposure period, the overlying water in each test chamber was gently aerated at a rate of 100 bubbles per minute throughout the exposure period and the organisms were fed three times a week. The test chambers were visually inspected daily for abnormal organism behavior or lack of burrowing, and water quality measurements of temperature, pH, dissolved oxygen, ORP, and salinity were recorded daily. Ammonia measurements were also recorded during the 28-day exposure period at test initiation and termination. At the end of the 28-day exposure period, the test organisms were retrieved from the test chambers and the number of live organisms (parent and offspring) in each chamber was recorded. The organisms were then dried and weighed. The mean percent survival, growth rate, and mean reproduction as young per surviving adult were calculated.

Additional details regarding the toxicity testing processes and procedures are provided in Appendix A.

2.3.5 Benthic Invertebrate Community

Normandeau Associates, Inc. (Normandeau) of Bedford, New Hampshire conducted benthic invertebrate community analyses on samples collected from the 30 SQT stations identified in Table 2-2. Three replicate samples were collected from each sampling station using a petite PONAR dredge (area of 0.023 square meters [m²]) or a standard PONAR dredge (area of 0.052 m²), as described in the SQT Field Report (GSH 2017). The samples were immediately sieved through a standard No. 30 (600 micron) sieve on the boat and the retained invertebrates were preserved with isopropyl alcohol (90%). Preserved samples were

transported to Normandeau's laboratory for analysis at the end of the sampling program. Organisms were identified to the genus/species (lowest practicable) phylogenetic endpoint using dissection and compound microscopes. Normandeau calculated metrics of taxonomic richness, population and community density, and Shannon-Weiner Diversity based on the sample results. Additional details regarding the benthic invertebrate community analysis are provided in Appendix C.

In addition to the taxonomic analysis, Normandeau also measured the dry-weight (shell-free) biomass of the 30 benthic invertebrate samples. Biomass for each sample was determined using *Standard Methods for the Examination of Water and Wastewater: Method 209 A – Total Residue Dried at 103-105 C* (American Public Health Association, American Water Works Association, and Water Pollution Control Federation 1980). All organisms were included in each sample weight. Shelled organisms (i.e., mollusks) had the tissue removed from the shell; shells were not included in the dry weight. Samples were weighed to 0.0001 gram using an analytical balance. Additional details regarding the biomass measurement are provided in Appendix D.

3. Results

This section presents the field data and results from the September 2015 SQT and porewater sampling program. Table 3-1 provides the list of sediment, tissue, and porewater samples analyzed for the target parameter groups. The target parameter groups are consistent with the parameters analyzed in sediment and tissue under the Cooperating Parties Group Lower Passaic River Restoration Project and Phases I and II of the Newark Bay sediment investigations. Appendix E includes summary tables of analytical chemistry results by matrix (sediment, tissue, and porewater), and Appendix F provides the laboratory data reports for the analytical chemistry results. In addition to the chemical analyses, a bioaccumulation study, two toxicity tests, and a benthic invertebrate community analysis were conducted. Appendix A includes the bioaccumulation study and toxicity testing laboratory reports, and Appendices C and D include the benthic invertebrate community and biomass laboratory reports, respectively.

Data verification/validation was completed in accordance with the SQT QAPP (Tierra 2015) for data collected under this program. Detailed information regarding all qualified samples can be found in the data verification/validation reports provided in Appendix G. An evaluation of the data quality and usability is provided in Appendix H.

For sediment chemistry, tissue chemistry, and porewater chemistry, statistical summaries of analytical chemistry data were prepared for each matrix and geographic area (see Sections 3.1, 3.2, and 3.3). For all statistical summaries, non-detect results were excluded from the calculations. For any given analyte, field duplicate sample results were evaluated with parent sample (i.e., corresponding sample) results to generate a single sample result for subsequent statistical analysis. When both the field duplicate and parent sample results were reported as detected concentrations, the sample concentrations were averaged to generate a single concentration value. When either the field duplicate sample or parent sample result was reported as a detected concentration and the corresponding sample result was not detected, only the detected concentration was used to represent the concentration of that analyte in that sample.

3.1 Sediment Chemistry

Forty-three surface sediment samples were collected from locations throughout Newark Bay and analyzed for the parameter groups and by the laboratories listed in Table 3-1. The analytical chemistry results for sediment samples are provided in Appendix E, Table E-1. Table 3-2 provides a list of constituents not detected in sediment samples. A statistical summary of detected constituents is provided in Table 3-3 for the 43 sediment samples. Results were also categorized by geographic area within Newark Bay (north, central, and south). Statistical summaries of samples by geographic area are provided in Tables 3-4 through 3-6. Concentrations of select constituents of interest are presented on Figures 3-1 through 3-9. These nine constituents were selected for summary presentation in this data report based on their high frequency of detection (i.e., occurrence in the majority of samples collected), and the USEPA's focus on this list for risk management considerations and calculation of preliminary remedial goals in the Focused Feasibility Study and Record of Decision for the lower eight miles of the Passaic River. These constituents have also been the subject of historical studies and concerns in various investigations conducted throughout the New

York/New Jersey Harbor Estuary, such as the USEPA's Regional Estuarine Monitoring and Assessment Program.

3.2 Bioaccumulation Study

Eight polychaete tissue samples were analyzed for the parameter groups listed in Table 3-1. The analytical results for polychaete tissue samples are provided in Appendix E, Table E-2. Table 3-7 provides a list of constituents not detected in polychaete tissue samples. A statistical summary of detected constituents is provided in Table 3-8 for the eight polychaete tissue samples. Results were also categorized by geographic area within Newark Bay (north, central, and south). Statistical summaries of samples by geographic area are provided in Tables 3-9 through 3-11. Concentrations of the same nine constituents of interest are presented on Figures 3-10 through 3-18. The laboratory data report for the bioaccumulation study is provided in Appendix A.

3.3 Porewater

Thirty porewater samples were analyzed for the parameter groups listed in Table 3-1. The analytical results for porewater samples are provided in Appendix E, Table E-3. Table 3-12 provides a list of constituents not detected in porewater samples. A statistical summary of detected constituents is provided in Table 3-13 for the 30 porewater samples. Results were also categorized by geographic area within Newark Bay (north, central, and south). Statistical summaries of samples by geographic area are provided in Tables 3-14 through 3-16. Concentrations of the same nine constituents of interest are presented on Figures 3-19 through 3-27.

While removing the dialysis bags from the sediment in the 5-gallon bucket in the laboratory for Location 155, one of the dialysis bags broke and the contents were lost. As such, there was not enough sample volume in the remaining dialysis bag to run all of the inorganics analyses. It was decided that samples would only be sent for analysis of total sulfide, mercury, and methylmercury for this sample.

A memorandum summarizing the methodology used in the calculation of porewater concentrations of organic compounds based on the *ex-situ* exposure of the PE and POM passive samplers is provided in Appendix B.

3.4 Toxicity Testing

Two toxicity tests were conducted on the sediment samples collected from the 30 SQT stations using *Leptocheirus plumulosus*: a short-term 10-day exposure for survival and a longer-term 28-day exposure for survival, growth, and reproduction. Toxicity results are summarized in Table 3-17 and are presented on Figure 3-28. The laboratory data report for toxicity testing is provided in Appendix A.

3.5 Benthic Invertebrate Community Analysis

Benthic invertebrate communities were characterized by identifying and enumerating the benthic invertebrates from sediment grab samples collected at the 30 SQT locations. The benthic community samples were identified to the lowest practicable taxonomic level and conducted in a manner consistent with other surveys performed in the New York/New Jersey (NY/NJ) Harbor Estuary (Weisberg et al. 1997). The taxonomic data are presented in Appendix C.

3.5.1 Calculation of Benthic Invertebrate Community Metrics

The benthic invertebrate community structure in the NBSA was characterized quantitatively using the following descriptive statistics and standardized metrics:

- Total Mean Density (Abundance)
- Taxonomic richness (number of species [or higher order taxa, if not identified to species] in a sample)
- Shannon-Wiener diversity index
- Pielou's evenness index
- Swartz's dominance index
- Benthic Index of Biotic Integrity (B-IBI).

These metrics were calculated using the mean of the three replicate samples collected at each sampling station. The equations and basis for the indices used to describe the community are presented below. Collectively, these indices will be used in the BHHERA to help evaluate the overall health and function of the benthic invertebrate community in the NBSA.

3.5.1.1 *Abundance and Taxonomic Richness*

Abundance is the number of individual organisms found per sample area. The mean abundance of organisms collected from the 30 SQT stations ranged from 406 to 11,237 per m² (Figure 3-29). Species richness is the total number of species represented in a sample, which does not take into account the abundance of organisms within a species. The mean species richness ranged from eight to 46 species per sample. A summary of the species abundance and richness is presented in Table 3-18 and on Figure 3-29.

Polychaeta were the dominant family overall at 61.2%, followed by Crustacea at 18.3%, as presented on Figure 3-30. Polychaeta were also the dominant group for each geographic zone of the NBSA, as presented on Figure 3-30.

The species that contributed to the top 10 most abundant taxa by region of the NBSA are presented in Table 3-19. Polychaetes comprised the most dominant taxa in the NBSA, with *Streblospio benedicti* as the most abundant species in each geographic region.

3.5.1.2 Shannon-Wiener Diversity Index

The Shannon-Wiener diversity index (Shannon 1948) is a measure of the species diversity of a sample and takes into account species richness and evenness of each species within the community. The number of species (or higher order taxa, if not identified to species) and the number of individuals within each taxa are combined to calculate the diversity index. The lowest index value is 0.0 and the highest, or maximum possible, is 4.0. The greater the value, the greater the sample diversity and the more evenly the organisms are distributed among the taxa present. It is calculated as follows:

$$H' = -\sum p_i \ln p_i$$

Where:

- H' = the diversity index
- ln = the natural logarithm
- Σ = summation
- p_i = the number of individuals within a taxon (n_i) divided by the total number of individuals (N) present in the entire sample

Shannon-Wiener diversity index values calculated from samples collected from 30 stations during the SQT program ranged from 1.5 to 3.0, with an average of 2.2 for the NBSA. A summary of Shannon-Wiener diversity index values for each station and geographic region is presented in Table 3-18 and on Figure 3-31.

3.5.1.3 Pielou's Evenness Index

Pielou's evenness index (Pielou 1966) is related to the Shannon-Wiener diversity index in that it also examines the distribution of individuals among taxa relative to an idealized distribution. Pielou's evenness index ranges from 0.0 to 1.0, with higher values indicating a more even distribution of organisms among the species present in the sample.

$$J = H' / H(\max)$$

Where:

- J = the evenness index
- H' = the Shannon-Wiener diversity index
- H(max) = the theoretical maximum value for H if all species in the sample were equitably distributed (i.e., natural logarithm S, where S is the total number of taxa in a sample)

The mean Pielou's evenness index calculated from samples collected from 30 stations during the SQT field program ranged from 0.5 to 0.9 for the NBSA. A summary of the Pielou's evenness index values for each station and geographic region is presented in Table 3-18 and on Figure 3-31.

3.5.1.4 *Swartz's Dominance Index*

Swartz's dominance index (Swartz et al. 1985) is an indicator of whether a small number of taxa dominate the sample. The index represents the number of taxa that constitute 75% of the total number of organisms in a sample. A higher index value (i.e., more species) indicates lower dominance, and a lower index value (i.e., fewer species) indicates higher dominance. The majority of locations sampled during the SQT program (67%) were dominated by five or more species based on the mean Swartz's dominance index. A summary of the Swartz dominance index values for each station and geographic region is presented in Table 3-18 and on Figure 3-31.

3.5.1.5 *Biomass*

Biomass is the dry weight of all species per sample. A statistical summary of biomass by geographic region is presented in Table 3-20. Biomass was calculated per square meter for each station based on the size PONAR (petite or standard) used to collect the sample. Biomass of samples collected from the 30 SQT stations ranged from 0.49 to 33.91 grams per square meter (g/m^2), with an average of 7.88 g/m^2 . A summary of the biomass data collected for each triplicate sample is included as Appendix D.

3.5.1.6 *Field Water Quality Measurements*

Water quality measurements (i.e., temperature, dissolved oxygen, salinity, conductivity, pH, and ORP) were collected during sediment collection activities at the 43 SQT sampling stations at mid-water level, and within 1 foot below the water surface and 1 foot above the sediment. The individual water quality measurements recorded at each sampling station are provided in Table 3-21.

3.5.2 Benthic Index of Biotic Integrity

A B-IBI is a quantitative method that uses biological activity to assess water body conditions between sites experiencing anthropogenic stress as compared to non-stressed reference locations across different habitat types. The B-IBI evaluates existing conditions by evaluating field metrics that, when combined, can effectively describe benthic communities (Weisberg et al. 1998). Although a number of metrics may be individually used to describe benthic communities, a combination multi-metric B-IBI is more effectively used to distinguish normal and abnormal conditions. A multi-metric B-IBI, similar to the freshwater B-IBI (Karr 1991; Kerans and Karr 1994) was developed for the saline environment of the NY/NJ Harbor area, hereafter referred to as the NY/NJ B-IBI (Weisberg et al. 1998), and is commonly used within the NY/NJ Harbor Estuary Program and its component agencies as a tool to assess benthic invertebrate community status at sites throughout the Harbor, including the NBSA.

The individual NY/NJ Harbor B-IBI metrics retained as part of the NBSA B-IBI assessment include the following:

- Species Diversity: A measure of community structure/site biodiversity, expressed as the total number of taxa (i.e., species richness).
- Biomass: A measure of total biological activity at a site, expressed as the ash-free dry weight of each species summed over all species present in the sample.
- Abundance: A measure of total biological activity at a site, used as an indicator for contaminant effects (Becker et al. 1990), expressed as total number of organisms.
- Composition – Percent Abundance of Pollution-Sensitive Taxa: A measure of undisturbed, mature communities, expressed as the percent abundance of taxa classified as pollution-sensitive to the total abundance of organisms in a sample.
- Composition – Percent Abundance of Pollution-Indicative Taxa: A measure of disturbed communities, expressed as the percent abundance of taxa classified as pollution-indicative (or tolerant) to the total abundance of organisms in a sample.

Threshold values for each metric are based on the NY/NJ B-IBI (Weisberg et al. 1998), which compared the metrics from samples to the metrics for reference stations. The data were divided into three percentile ranges, and a score (i.e., 1, 3, or 5) was assigned to each threshold value range. The scores indicate whether the metric was similar to (threshold value of 1), deviated slightly from (threshold value of 3), or deviated greatly from (threshold value of 5) conditions at the reference sites (Weisberg et al. 1998).

The metrics collected as part of the NBSA B-IBI assessment were scored using the threshold values from the NY/NJ B-IBI. The threshold values for the 30 SQT samples are presented in Table 3-22. The NY/NJ B-IBI thresholds used to score each metric for the NBSA B-IBI are included in Appendix I.

To calculate the B-IBI scores for the NBSA, samples were first categorized by habitat according to salinity and grain size. As shown in Table 3-21, salinity throughout the bay averaged approximately 24 ppt, indicating a polyhaline environment. Grain size varied throughout the NBSA. Six sampling locations were categorized as sand and the remaining 24 locations were categorized as mud, based on the amount of silt and clay in each sample. Based on these results, B-IBI metrics were compared against the threshold scoring values for polyhaline mud and polyhaline sand.

The individual scores for all metrics were combined into the B-IBI by computing the average across all five metrics. Samples with index values of 3.0 or greater are considered to have good benthic condition, indicative of good habitat quality. Communities with an index score less than 3.0 are considered stressed. Scores for individual metrics are presented in Table 3-22.

B-IBI scores for the NBSA ranged from 1.8 to 4.2, with an overall average of 3.1. A summary of the B-IBI scores for each station and geographic region is presented in Table 3-22 and on Figure 3-32. B-IBI scores will be evaluated further once the Phase III surface sediment sampling results are available.

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

ASTM = American Society for Testing Materials

AVS/SEM = acid volatile sulfide/simultaneously extracted metals

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HMW = high molecular weight

LMW = low molecular weight

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

TCDD = tetrachlorodibenzo-p-dioxin

TEPH = total extractable petroleum hydrocarbons

NA = not applicable

% = percent

mg/kg = milligrams per kilogram

ng/g = nanograms per gram

ng/kg = nanograms per kilogram

pg/g = picograms per gram

ppb = parts per billion

ug/kg = micrograms per kilogram

umol/g = micromoles per gram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

ASTM = American Society for Testing Materials
AVS/SEM = acid volatile sulfide/simultaneously extracted metals
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
TCDD = tetrachlorodibenzo-p-dioxin
TEPH = total extractable petroleum hydrocarbons
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ppb = parts per billion
ug/kg = micrograms per kilogram
umol/g = micromoles per gram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

ASTM = American Society for Testing Materials

AVS/SEM = acid volatile sulfide/simultaneously extracted metals

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HMW = high molecular weight

LMW = low molecular weight

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

TCDD = tetrachlorodibenzo-p-dioxin

TEPH = total extractable petroleum hydrocarbons

NA = not applicable

% = percent

mg/kg = milligrams per kilogram

ng/g = nanograms per gram

ng/kg = nanograms per kilogram

pg/g = picograms per gram

ppb = parts per billion

ug/kg = micrograms per kilogram

umol/g = micromoles per gram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

ASTM = American Society for Testing Materials
AVS/SEM = acid volatile sulfide/simultaneously extracted metals
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
TCDD = tetrachlorodibenzo-p-dioxin
TEPH = total extractable petroleum hydrocarbons
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ppb = parts per billion
ug/kg = micrograms per kilogram
umol/g = micromoles per gram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ug/kg = micrograms per kilogram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ug/kg = micrograms per kilogram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ug/kg = micrograms per kilogram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

% = percent
mg/kg = milligrams per kilogram
ng/g = nanograms per gram
ng/kg = nanograms per kilogram
pg/g = picograms per gram
ug/kg = micrograms per kilogram

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

ng/L = nanograms per liter
pg/L = picograms per liter

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

ng/L = nanograms per liter
pg/L = picograms per liter

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

ng/L = nanograms per liter
pg/L = picograms per liter

Footnotes:

¹Valid results are results that were found to be valid as a result of data validation. Only valid data are used in statistical analyses. Additional details regarding rejected data are provided in Appendix H of this report.

Notes:

1. Only detected values were included in the calculation of totals.
2. Non-detect ("U" qualified) data were excluded from the statistical analysis.
3. Field duplicate samples were averaged to create one result prior to statistical reporting. Additional details regarding field duplicate handling can be found in Section 3.0 of the report.

DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
HMW = high molecular weight
LMW = low molecular weight
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
NA = not applicable

ng/L = nanograms per liter
pg/L = picograms per liter

Footnotes:

- (a) Growth rate or reproduction not calculable for samples with no surviving organisms.
- (b) Survival out of 101 individuals.
- (c) Survival out of 102 individuals.

Notes:

- 1. Survival all out of 100 individuals, except where indicated.
- 2. Shaded cells are considered significantly different than the control ($p=0.05$).

mg = milligrams
S.D. = standard deviation

<i>Median</i>	22	3,518	2.2	0.7	5
<i>Standard Deviation</i>	9	3,338	0.32	0.1	2

Notes:

¹ Total Taxa (Richness) is the total number of species [or higher order taxa, if not identified to species] in a sample.

² Total Mean Density is the number of individual organisms found per sample area. The values are prepared by counting the number of distinct individual organisms in a given sample.

³ Shannon Wiener Diversity Index is a measure of the species diversity of a sample and takes into account species richness and evenness of each species within the community. The formula for calculating the Shannon Wiener Diversity Index is provided in Section 3.5.1.2.

⁴ Pielou's Evenness is related to the Shannon-Wiener diversity index in that it also examines the distribution of individuals among taxa relative to an idealized distribution. The formula for calculating Pielou's Evenness is provided in Section 3.5.1.3.

⁵ Swartz's Dominance is an indicator of whether a small number of taxa dominate the sample. The formula for calculating Swartz's Dominance is provided in Section 3.5.1.4.

no./m² = number of organisms per square meter

**Table 3-19
Dominant Taxa Summary**

Taxa		Zone				
		North	South	Central	Overall	
Annelida						
	Oligochaeta	Oligochaeta	4	2	7	4
	Polychaeta	<i>Hypereteone heteropoda</i>	--	10	8	--

1. INTRODUCTION

At the request of the Tierra Solution, Inc., EA Engineering, Science, and Technology performed whole sediment toxicity testing and bioaccumulation testing on sediment samples collected from the Newark Bay, New Jersey Study Area, in support of Tierra's development of a risk assessment, pursuant to an Administrative Order on Consent (AOC) with the United States Environmental Protection Agency (US EPA). The purpose of this study was to evaluate the toxicity and bioaccumulation potential of the sediment samples.

The toxicity testing program consisted of: 1) 10-day whole sediment toxicity tests with *Leptocheirus plumulosus* (marine amphipod); 2) 28-day whole sediment toxicity tests with *Leptocheirus plumulosus*; and 3) 28-day bioaccumulation tests with *Nereis virens* (sand worm). The whole sediment toxicity tests evaluated the effects of exposure to the sediment samples on survival, growth or reproduction of the test organisms. The bioaccumulation test evaluated survival of the test organisms and bioaccumulative effects as a result of exposure to the sediment samples. At the completion of the bioaccumulation testing, the organism tissues were submitted for selected chemical analyses, the results of which are not included in this report.

2. MATERIALS AND METHODS

2.1 SAMPLE RECEIPT AND PREPARATION

Thirty-five sediment samples from Newark Bay, New Jersey Study Area, were collected and composited by Tierra personnel. The sediment samples were placed into 5-gallon pails. The samples were held at $\leq 4^{\circ}\text{C}$ and were hand delivered to EA's Ecotoxicology Laboratory in Hunt Valley, Maryland. Upon receipt at EA, the sediment samples were logged in and assigned EA laboratory accession numbers, and were stored in the dark in a secured walk-in cooler at $\leq 4^{\circ}\text{C}$ until used for testing. Table 1 summarizes the sample identification, accession numbers, and collection/composite and receipt information for the sediment samples. Chain-of-custody records are included in Attachment I.

2.2 LABORATORY WATER

Artificial seawater was used as the overlying water. The artificial seawater was prepared by mixing Crystal Sea synthetic sea salts with laboratory water to a final salinity of 30 ppt or 20 ppt. The source of the laboratory water was the City of Baltimore municipal tap water that was passed through a high-capacity, activated carbon filtration system. This synthetic seawater formulation has proven acceptable for aquatic toxicological studies, and has been used successfully at EA for maintaining multigeneration cultures of opossum shrimp, and for holding healthy populations of estuarine and marine species. Batches of artificial seawater were aerated and aged at least 24 hours prior to use in testing.

2.3 CONTROL AND REFERENCE SEDIMENT

A sample of sediment from Pretty Boy Reservoir, Maryland was collected for use as the control sediment for the *L. plumulosus* testing. Sediment collected from this location has historically been non-toxic and is routinely utilized as a control sediment in EA's toxicity tests. A natural sediment from the organism collection site was used as laboratory controls in the bioaccumulation testing. Control sediment used in the *N. virens* test was collected from the Damariscotta River, Booth Bay Harbor, Maine.

2.4 TOXICITY TEST METHODS

The toxicity tests performed during this study were conducted in accordance with the appropriate guidance, as indicated in the following sections. The test methodologies followed EA's standard toxicity testing protocols (EA 2013) and the results comply with current NELAC standards, except where noted in the report.

2.4.1 *Leptocheirus plumulosus* 10-Day Toxicity Testing

The 10-day *L. plumulosus* acute toxicity testing was conducted in accordance with US EPA (1994) guidance. The *L. plumulosus* were acquired from Chesapeake Cultures (Hayes, Virginia). Lot LP-076 was received at EA on 30 October 2015 and was used to initiate the toxicity test on the same day. During the holding period, the organisms were gradually acclimated to laboratory water at 20°C and to the appropriate test salinity.

The tests were conducted in 1-liter beakers each containing 175 ml of sediment and 800 ml of overlying water. The tests were performed with five replicates per sediment sample. The sediment and overlying water were added to the chambers 7 days prior to introduction of the test organisms. The beakers were left undisturbed to allow any suspended sediment particles in the water column to settle and equilibrate. Twenty organisms were randomly introduced into each replicate beaker. The introduction of the test organisms to the test chambers marked the initiation of the toxicity tests. The tests were maintained at a target of 20±1°C, with a 24-hour light photoperiod. The test chambers were visually inspected daily for abnormal organism behavior or lack of burrowing. The test organisms were not fed during the 10-day exposure period.

The whole sediment toxicity tests were conducted as static, non-renewal tests with ten days of exposure to the composite sediments and overlying water. Artificial seawater (Crystal Sea artificial sea salts) at 20 ppt salinity was used as the overlying water. Water quality measurements of temperature, pH, dissolved oxygen, and salinity were recorded daily on one replicate of each sample and control. Oxidation/Reduction Potential was measured daily on five

randomly selected samples from day -7 through test termination on day 10. The ORP probes remained in the test chambers throughout the duration of the testing. Initial pore water was preserved upon sample receipt for analysis. The water quality parameters measured during the *L. plumulosus* toxicity tests are summarized in Tables 2, 4 and 7.

After ten days of exposure, the test organisms were retrieved from the samples and the number of live organisms per replicate was recorded, a summary of the results can be found in Table 8. Copies of the original data sheets for the *L. plumulosus* 10-day toxicity testing are included as Attachment II.

2.4.2 *Leptocheirus plumulosus* 28-Day Toxicity Testing

The 28-day *L. plumulosus* chronic toxicity testing was conducted in accordance with US EPA (2001) guidance. The *L. plumulosus* were acquired from Chesapeake Cultures (Hayes, Virginia). Lot LP-075 was received at EA on 21 October 2015 and was used to initiate the toxicity tests on the same day. However, upon retrieving the organisms from the sediment at the 28 day endpoint, it was determined that the control had unacceptable mortality (25 percent), which invalidated the testing. Evaluation of the health of the organisms upon receipt indicated no observable issues and the lot had an acceptable associated reference toxicant test. A reanalysis of the sediments was initiated on 25 November 2015, using lot LP-078, acquired from the same organism source. During the holding period, the organisms were gradually acclimated to laboratory water at 25°C and to the appropriate test salinity.

The tests were conducted in 1-liter beakers each containing 175 ml of sediment and 800 ml of overlying water. The tests were performed with five replicates per sediment sample. The sediment and overlying water were added to the chambers 7 days prior to introduction of the test organisms. The beakers were left undisturbed to allow any suspended sediment particles in the water column to settle and equilibrate. Twenty organisms were randomly introduced into each replicate beaker. The introduction of the test organisms to the test chambers marked the initiation of the toxicity tests. The test chambers were placed in an environmental chamber and maintained at a target temperature of 25±1°C with a 16-hour light/8-hour dark photoperiod. The overlying water was gently aerated at a rate of 100 bubbles per minute throughout the 28-day exposure period. During the first two weeks of the exposure period, the *L. plumulosus* were fed three times a week with 1 ml/replicate of a 20 mg/ml slurry of finely ground Tetramin in

deionized water. This feeding schedule was maintained during weeks three and four, however the concentration of the slurry was increased to 40 mg/ml Tetramin, to provide additional food for the older (larger) test organisms.

The overlying water in the exposure chambers was renewed three times each week by siphoning 400 ml of the old overlying water from each test chamber, and then slowly siphoning fresh replacement water into the chamber, taking care not to disturb the sediment. Temperature, pH, dissolved oxygen, and salinity measurements were recorded daily on the overlying water in one replicate of each sediment. Ammonia measurements were conducted on composite samples of pore and overlying water from each sediment sample at test initiation and termination. Additionally, initial pore water was preserved upon sample receipt for analysis. Oxidation/Reduction Potential was measured daily on five randomly selected samples from day -7 through test termination on day 28. The ORP probes remained in the test chambers throughout the duration of the testing. These water quality measurements are summarized in Tables 3, 5 and 7.

At the end of the 28-day exposure period, the surviving adult organisms from each replicate were retrieved by screening through a 500 μm sieve. The number of surviving adult *L. plumulosus* from each replicate was recorded, and the surviving adults from each replicate were placed in a dried, pre-weighed tin and placed in a drying oven overnight at 100°C. The tins were then removed from the oven and placed in a desiccator to cool. Each pan was weighed to the nearest 0.01 mg to determine a mean dry weight per replicate, obtained by dividing the total organism dry weight per replicate by the number of surviving organisms per replicate. The growth rate per replicate was calculated by subtracting the mean initial dry weight of the test organisms from the final mean dry weight per replicate, divided by 28 days. Initial dry weights were determined prior to test initiation, using three replicates of 20 randomly selected organisms. Material that passed through the 500 μm sieve when recovering the adult organisms was retained on a 250 μm sieve to retrieve the offspring. Amphipods and residual sediment that was retained on the 250 μm sieve was rinsed with freshwater to remove salts, and was washed into a sample jar. The offspring were stained with a 1g/L solution of rose bengal, and preserved with 70% alcohol. The offspring were counted, and the reproduction endpoint was calculated as the number of offspring per surviving adult. A summary of survival, growth rate and reproduction

for the *L. plumulosus* exposed to each sediment sample is provided in Table 9. Copies of the original data sheets for the 25 November 2015 *L. plumulosus* 28-day toxicity testing are included as Attachment III.

2.4.3 *Nereis virens* Bioaccumulation Testing

Bioaccumulation testing was conducted using the sand worm (*Nereis virens*) according to USEPA/USACE (1998) guidance. The adult worms (NV-055) were received from Aquatic Research Organisms (Hampton, New Hampshire) on 22 October 2015. The *N. virens* were loaded into the test immediately to minimize cannibalism/holding stress.

The sediment samples and overlying water were added to the test chambers 7 days prior to test initiation to allow time for the suspended sediments to settle and equilibrate. The overlying water was 30 ppt artificial seawater (Crystal Sea artificial sea salts). The bioaccumulation tests were 28 days in duration and were conducted as static renewal assays. The overlying water was replaced three times a week by siphoning approximately 80 percent of the overlying water from the aquaria, and replacing with new overlying water, taking care not to disturb the sediment surface.

The bioaccumulation tests were conducted in 10-gallon aquaria with 5 L of sediment and 22 L of overlying water per aquarium. There were five replicates per reference and test sediment, and three replicates per control sediment. Based on the analytical tissue biomass requirements, 25 organisms were randomly introduced into each replicate chamber for the *N. virens* testing.

During the 28-day exposure period, the test chambers were maintained at a target temperature of $20\pm 1^{\circ}\text{C}$ with a 16-hour light/8-hour dark photoperiod. Gentle aeration was provided to each aquarium throughout the test period. Observations of mortality and abnormal organism behavior were recorded daily, and dead organisms were removed, as observed, from the test chambers. Measurements of temperature, pH, dissolved oxygen, and salinity of the overlying water were recorded on one replicate of each sample and control at test initiation, termination, and three times a week prior to replacement of the overlying water. Oxidation/Reduction Potential was measured daily on five randomly selected samples from day -7 through test termination on day

28. The ORP probes remained in the test chambers throughout the duration of the testing. The water quality measurements are summarized in Table 6 and 7. The organisms were not fed during the exposure period.

The bioaccumulation tests were initiated on 22 October and completed on 19 November 2015. After 28 days of exposure, the organisms were recovered from the samples and placed into clean artificial sea water for 24 hours to purge their digestive tracts, a summary of the percent recovery can be found in Table 10. After the depuration period, the organism tissues were collected and submitted for chemical analyses. Copies of the original data sheets are included in Attachment IV.

2.4.4 Reference Toxicant Testing

In conformance with EA's quality assurance/quality control program requirements, reference toxicant testing was performed by EA on the acquired lots of *L. plumulosus* and *N. virens* utilized in the testing program. The reference toxicant tests consisted of a graded concentration series of a specific toxicant in water only tests, with no sediment present in the test chambers. The results of the reference toxicant tests were compared to established control chart limits. Table 11 presents the results of the reference toxicant testing. Cumulative reference toxicant test data are included in Attachment V.

2.5 ARCHIVES

Original data sheets, records, memoranda, notes, and computer printouts are archived at EA's office in Hunt Valley, Maryland. These data will be retained for a period of 5 years unless a longer period of time is requested by Tierra Solutions, Inc.

3. RESULTS AND DISCUSSION

This bioassay/bioaccumulation study with the composited sediments from Newark Bay, New Jersey Study Area was conducted in support of Tierra's development of a risk assessment pursuant to an Administrative Order on Consent (AOC) with the United States Environmental Protection Agency (US EPA). The results of these toxicity tests met the current NELAC standards, where applicable. All testing met the minimum test acceptability criteria outlined in US EPA (1994, 2001) and US EPA/USACE (1998) guidance, with exceptions noted.

3.1 *Leptocheirus plumulosus* 10-DAY TOXICITY TESTING

Table 8 summarizes the results of the 10-day whole sediment toxicity testing with *L. plumulosus*. Survival in the sediment samples NB03SED-TOX151, NB03SED-TOX154, NB03SEDDUP-02 and NB03SEDDUP-03 was 39, 32, 36 and 46 percent, respectively, which was significantly different ($p=0.05$) than the control (90 percent survival). Survival in the remaining sediment samples ranged from 81 to 98 percent, none of which were significantly different than the control.

3.2 *Leptocheirus plumulosus* 28-DAY TOXICITY TESTING

Results of the *L. plumulosus* chronic sediment toxicity test are summarized in Table 9. After 28 days of exposure, samples NB03SED-TOX141, NB03SED-TOX151, NB03SEDDUP-02, NB03SED-TOX154, NB03SEDDUP-03, NB03SED-TOX158, NB03SED-TOX160, and NB03SED-TOX143 had 67, 0, 0, 7, 11, 39, 0 and 30 percent survival, respectively, and were significantly less ($p=0.05$) than the control sample, which had 81 percent survival. Survival in sample NB03SED-TOX138, NB03SED-TOX142, NB03SED-TOX146 and NB03SED-TOX145 was 46, 53, 54 and 59 percent, respectively, which were greater than 25 percent different from the control, however due to a high degree in variability the samples were not found to be significantly different than the control. Survival in the remaining sediment samples ranged from 62 to 96 percent, and were not significantly different from the control sample.

Growth rate was significantly reduced in 17 samples compared to the control sediment, while the growth rate was not calculable in the three samples that had no surviving organisms after 28 days

exposure. The growth rate for significantly different samples ranged from 0.001 to 0.037 mg/surviving organism/day, while the control sediment had a growth rate of 0.045 mg/surviving organism/day. It should be noted that the growth rates in samples NB03SED-TOX161, NB03SED-TOX156 and NB03SED-TOX162, ranged from 0.034 to 0.037 mg/surviving organism/day, and were found to be significantly different than the control, however, they were less than 25 percent different than the control sample. Additionally, the percent minimum significant differences (PMSDs) for the comparisons ranged from 8.8 to 15.6, which indicated high test sensitivity. The PMSD is a measure of within-test variability, and a low PMSD indicates an unusually high precision, that is, a small difference between a test concentration and the control can be detected as a significant toxic effect and should be considered when interpreting the data. The growth rate in 11 sediment samples were not significantly less than the control sediment and ranged from 0.028 to 0.050 mg/surviving organism/day.

Mean young production in the test sediments 11 sediment samples was significantly different than the control, with mean young production ranging from 0.00 to 0.68 young per surviving adult, compared to 1.97 young per surviving adult. Additionally, the mean young production was not calculable in the three samples that had no surviving organisms after 28 days exposure. Mean young production in 18 samples was not significantly different than the control and ranged from 0.58 to 1.93 young per surviving adult.

3.3 *Nereis virens* 28- DAY BIOACCUMULATION TESTING

Tables 10, summarizes the survival of *N. virens* following 28 days of exposure to the sediment samples. Percent recovery of *N. virens* exposed to the samples ranged from 92 to 100 percent. Percent recovery in the laboratory control was 100 percent. It should be noted that any site having less than 97 percent recovery was found to be significantly different than the control. The percent minimum significant differences (PMSDs) for comparisons that were statistically significant ranged from 2.5 to 5.2, which indicates very high test sensitivity. The PMSD is a measure of within-test variability, and a low PMSD indicates an unusually high precision, that is, a very small difference between a test concentration and the control can be detected as a significant toxic effect and should be considered when interpreting the data. Additionally, based

on the fact that there was greater than 90 percent survival of organisms in all test sediments, the statistically significant differences are not considered biologically meaningful.

3.4 REFERENCE TOXICANT TESTS

The results of the reference toxicant tests are summarized in Table 11. All of the reference toxicant test results fell within the established laboratory control chart limits.

(a) Initial pore water was preserved for each sample upon receipt at the laboratory.

(b) Porewater preserved on Day 0 for analysis. Analysis occurred after test initiation and measured pore water ammonia on Day 0 was reviewed for procedural abnormalities and none were noted. Sufficient sample was not available for reanalysis. No corrective action was implemented.

NB03SED-BIO149MSD	AT5-429	99 / 101	98
NB03SEDDUP-05	AT5-430	98 / 101	97
NB03SED-BIO160	AT5-436	99 / 100	99

(a) Significantly different than the control (p=0.05). See discussion in Results section.

TABLE 11 RESULTS OF REFERENCE TOXICANT TESTING ON ACQUIRED LOTS OF TEST ORGANISMS –
NEWARK BAY STUDY AREA, NEW JERSEY

Test Species	Organism Lot Number	Reference Toxicant	Test Endpoint	Acceptable Control Chart Limits
<i>Leptocheirus plumulosus</i>	LP-075	Cadmium chloride (CdCl ₂)	48-Hour LC50: 14.5 mg/L Cd	3.7 – 21.7 mg/L Cd
<i>Leptocheirus plumulosus</i>	LP-076	Cadmium chloride (CdCl ₂)	48-Hour LC50: 7.1 mg/L Cd	3.3 – 22.1 mg/L Cd
<i>Leptocheirus plumulosus</i>	LP-078	Cadmium chloride (CdCl ₂)	48-Hour LC50: 13.6 mg/L Cd	1.8 – 21.4 mg/L Cd
<i>Nereis virens</i>	NV-055	Potassium chloride (KCl)	48-Hour LC50: 1,439 mg/L KCl	584 – 1,584 mg/L KCl

ATTACHMENT II

Leptocheirus plumulosus 10-Day Whole Sediment Test
Data Sheets and Statistical Analyses
(90 pages)

SEDIMENT TOXICITY TEST SET-UP BENCH SHEET

Project Number: 70005.15

Client: Tierra Solutions

QC Test Number: TN-15-403

TEST ORGANISM INFORMATION

Common Name: Amphipod Adults Isolated (Time, Date): _____
 Scientific Name: Leptocheirus plumulosus Neonates Pulled (Time, Date): _____
 Lot Number: LP-076 Acclimation: 24hrs Age: 2-4 mm
 Source: Chesapeake Cultures Culture Water (T/S): 23.9 °C 22.2 ppt

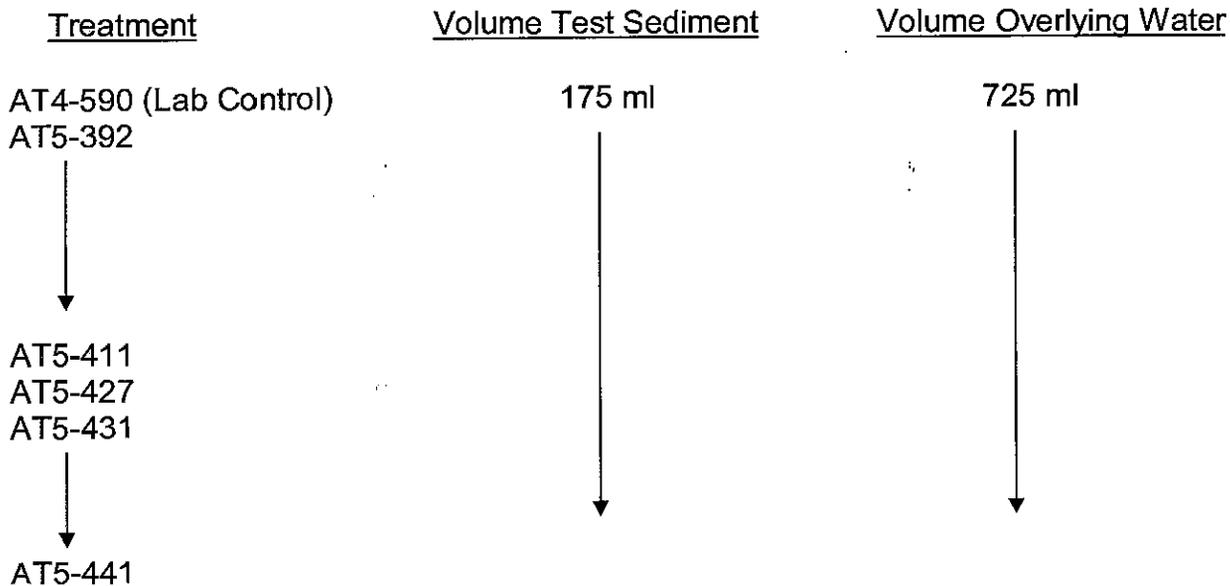

TEST INITIATION

Date	Time	Initials	Activity
10/23/15	1400	IM/MJ	Sediment Added to Chambers
↓	1610	MJ	Overlying Water Added to Chambers
10/30/15	1430	MJ/IM	Organisms Transferred

TEST SET-UP

Sample Number(s): AT4-590, AT5-392→411, 427, 431→441

Overlying Water: 20 ppt Crystal Sea (LD5-464)

Leptocheirus plumulosus 28-Day Whole Sediment Test
Data Sheets and Statistical Analyses
(227 pages)

SEDIMENT TOXICITY TEST SET-UP BENCH SHEET

Project Number: 70005.15

Client: Tierra Solutions

QC Test Number: TN-15-491

TEST ORGANISM INFORMATION

Common Name: Amphipod Adults Isolated (Time, Date):
 Scientific Name: Leptocheirus plumulosus Neonates Pulled (Time, Date):
 Lot Number: LP-078 Acclimation: <24h Age: >250 µm <500 µm
 Source: Chesapeake Cultures Culture Water (T/S): 23.5 °C 21.4 ppt

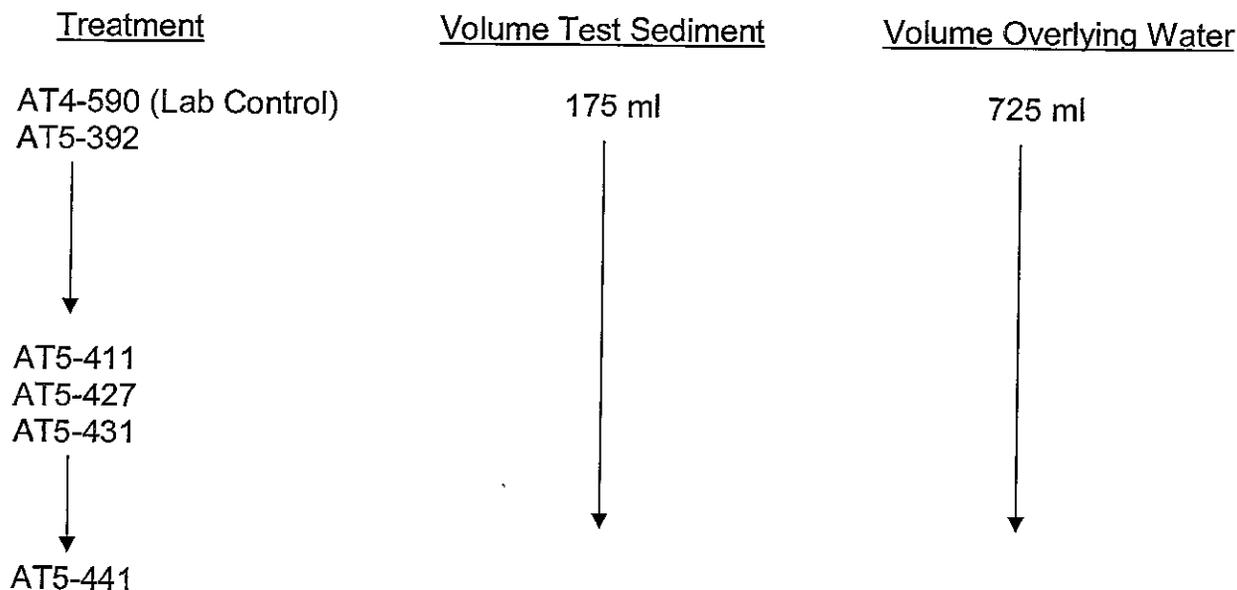

TEST INITIATION

Date	Time	Initials	Activity
11/18/15	1400	VY, JM, MJ, JM, KM	Sediment Added to Chambers
11/18/15	1500	↓	Overlying Water Added to Chambers
11/25/15	1540	MC, MD, WM	Organisms Transferred

TEST SET-UP

Sample Number(s): AT4-590, AT5-392→411, 427, 431→441

Overlying Water: 20 ppt Crystal Sea (LD5-546)

TOXICITY TEST WATER QUALITY DATA SHEET - NEW SOLUTIONS

Project Number: 70005.15
 Client: Tierra Solutions
 QC Test Number: TN-15-491

TEST ORGANISM
 Common Name: Amphibod
 Scientific Name: Leptocheirus plumulosus

Beginning Date: 11/25/15 Time: 1540
 Ending Date: 12/23/15 Time: 1115

TARGET VALUES Temp: 25 °C pH: 6.0 - 9.0 DO: ≥4.0 mg/L Salinity: 20 ppt Photoperiod: 16-hr / 8 d Light Intensity: 50 - 100 fc

Sample #	Temperature (°C)							pH							Dissolved Oxygen (mg/L)							Salinity (ppt)												
	0	1	2	3	4	5	6	0	1	2	3	4	5	6	0	1	2	3	4	5	6	0	1	2	3	4	5	6

Auxiliary Tests

	Statistic	Critical	Skew	Kurt
Kolmogorov D Test indicates non-normal distribution ($p \leq 0.01$)	1.13834	1.035	-0.6404	0.27866
Equality of variance cannot be confirmed				

Hypothesis Test (1-tail, 0.05)

Wilcoxon Rank Sum Test indicates significant differences

SEDIMENT TOXICITY TEST OBSERVATION DATA SHEET

Project Number: 70005.15 TEST ORGANISM: 10/22/15 Time: 1600
 Client: Tierra Solutions Common Name: Sand worm Ending Date: 11/19/15 Time: 1315
 QC Test Number: TN-15-405 Scientific Name: Neries virens
 Test Material(s): SEDIMENT TEST TYPE: Static / Flowthrough Test Container: 10 gal aquarium
 Accession Number(s): Multiple Renewal / Non-renewal Test Volume: 5 L sed / 22 L water
 Overlying Water: 30 PPT Crystal Sea Photoperiod: 16 L 8 d Light Intensity: 50 - 100 fc Test Duration: 28 days
 Accession Number: LD5-465

MEMORANDUM

From: Upal Ghosh and Mehregan Jalalizadeh, University of Maryland Baltimore County

To: Clifford Firstenberg & Carlie Thompson, Tierra Solutions, Inc.

Date: April 10, 2017

Subject: Summary on the Calculation of Porewater Concentrations of Organic Compounds from Passive Samplers

This memorandum summarizes the calculation of porewater concentrations of organic compounds based on the ex-situ exposure of polyethylene (PE) and polyoxymethylene (POM) passive samplers to sediments in a laboratory-controlled setting at the University of Maryland Baltimore County (UMBC). Following exposure, the PE and POM samplers were transferred from UMBC to commercial contract laboratories where the target organic compounds (PAHs, PCBs, dioxins/furans, and pesticides) were extracted in solvent (acetone/hexane (1:1 by volume)) and the concentrations in final extracts were determined by the analytical lab.

Porewater concentrations were estimated using the laboratory-reported concentrations in the PE/POM extracts based on the *Standard Operation Procedure (SOP) for the Measurement of Hydrophobic Organic Constituents in Sediment Porewater by Passive Sampling*; (Ghosh 2015). This was SOP L-40 of the *Sediment Quality Triad and Porewater Sampling and Analysis Quality Assurance Project Plan (QAPP), Revision 2* (Tierra Solutions, Inc. 2015). PE passive samplers loaded with performance reference compounds (PRCs) were used to determine the freely dissolved porewater concentrations of PCBs, PAHs, and pesticides. POM passive samplers (without PRCs) were used to measure freely dissolved concentrations of dioxins and furans.

The porewater concentration estimation process is briefly summarized as follows:

1. Calculating concentrations of chemicals in PE/POM based on the concentrations in solvent extracts

Concentrations of PAHs, PCBs, and dioxins/furans in PE/POM solvent extracts were measured after concentrating to 1mL by the analytical lab. These values were converted to concentrations in PE (for PCBs, PAHs, and Pesticides) and POM (for dioxins):

$$C_{PS} = C_{solvent} * V_{solvent} / M_{PS} \quad \text{Equation 1}$$

Where C_{PS} is the concentration of the chemical in the passive sampler (ng/mg), $C_{solvent}$ is the concentration of the chemical in the final volume of solvent extract (ng/ml), $V_{solvent}$ is the final volume of the solvent extract (mL), and M_{PS} is the mass of the passive sampler (mg).

Pesticide concentrations were reported by the analytical lab as concentrations in PE passive samplers.

2. Determining loss of Performance Reference Compounds (PRCs) from PE and correction of porewater concentrations for non-equilibrium

According to Ghosh (2015), for PRC losses greater than 80%, no PRC correction is required and the porewater concentrations (C_{free}) can be calculated based on the polymer-water partition constant (K_{PS}):

$$C_{free} = C_{PS}/K_{PS} \quad \text{Equation 2}$$

The fractional loss of PCB PRCs was calculated using the initial and final concentrations in PE. The loss of PCB PRCs was greater than 80% in most sediment samples. Smaller fractional losses of at least one PCB PRC were detected in eight sediment samples (NB03SED138, NB03SED141, NB03SED143, NB03SED145, NB03SED146, NB03SED153, NB03SED154, and NB03SED161).

Thus, for sediment samples where all PCB PRCs were lost more than 80% no PRC corrections were performed. F_{eq} (fraction to equilibrium) of the PCB congeners, for which the corresponding PRC loss was more than 80%, is equal to 1 (F_{eq} values are indicated in the columns next to the PRC corrected values in the spreadsheet). That means equilibrium concentration is the same as the concentration detected in the passive sampler for those congeners and no PRC correction was performed. For the remaining 8 samples where some PRCs were lost less than 80%, PRC corrections were performed for PCB congeners based on Fernandez et al. (2009). For PCB congeners which were co-eluting, the average K_{PE} values were used¹. For the sediments that required PRC correction for PCBs, the average fractional equilibrium of co-elutes were used to calculate the equilibrium concentrations.

For the pesticides, fractional equilibrium of individual compounds was calculated based on the loss of PCB PRCs and was found to be >80%, as specified in the QAPP/SOP (Ghosh 2015). Thus, no PRC corrections were performed for the porewater concentrations of pesticides.

Risk assessment will address the uncertainty in the porewater concentration.

The four PAH PRCs used in the study were determined to be below the analytical reporting limits after exposure to sediments. If the reporting limit value is used to calculate the PRC loss, the losses are less than 80%, which does not provide the information necessary for the PRC correction. However, previous work by Perron et al. (2013), demonstrate for several sediments that when PCB and PAH PRCs are used simultaneously, the losses of PAH PRCs are similar or higher than corresponding PCB PRCs. The most hydrophobic PAH PRC, (Dibenz(a,h)anthracene-d14), has a log K_{OW} very close to PCB PRC ¹³C₁₂-PCB79. This PCB PRC was lost more than 95% in all sediment samples except for sediment sample NB03SED145.

¹The correlation provided by Ghosh et al. (2014) was used to estimate K_{PE-w} for PCBs. The correlation is: $1.18 * \log K_{ow} - 1.26$. For PCB congeners that were co-eluting, the average K_{PE-w} values were used.

Thus, it would be reasonable to anticipate that all PAH PRCs were lost at least 80% in the sediment samples except for NB03SED145. Thus, no PRC corrections were performed for PAH porewater concentrations except for sediment NB03SED145. For the sample NB03SED145, PCB PRC loss was used to correct for non-equilibrium of the PAH compounds.

Dioxin/furan porewater concentrations are potentially biased low, since they were derived from the POM passive samplers that were not impregnated with PRCs to assess equilibrium. The risk assessment will address the uncertainty in the porewater concentrations and the potential uncertainty in the partitioning values in the literature.

3. Source of K_{PE} , K_{POM} , and K_{OW} values used in the calculations of porewater concentration

In accordance with the QAPP/SOP (Ghosh 2015), the K_{PE} values were determined as follows:

- For PCBs and parent PAHs: correlation provided in Ghosh et al. (2014)
- For alkylated PAHs: correlation provided in Choi et al. (2013)
- O,P'-DDD, O,P'-DDE, O,P'-DDT, P,P'-DDD, P,P'-DDE, and P,P'-DDT: K_{PE} were obtained from Fernandez et al. (2014)
- Other pesticides: correlation provided in Fernandez et al. (2012)
- For all other hydrophobic organic compounds, a $K_{PE}:K_{OW}$ correlation based on data provided for pesticides and PCBs in Fernandez et al. (2012) was used.

K_{POM} values for dioxins and furans were obtained from Cornelissen et al. (2008).

The sources of K_{OW} values are indicated in Tables 1 and 2.

The log K_{OW} of all the congeners in C1-naphthalenes, C1-fluoranthenes/pyrenes, C2-naphthalenes, C2-phenanthrene/anthracene, C3-naphthalenes, C4-naphthalenes groups are provided in Choi et al. (2013) (Supporting Information Table 2). The log K_{OW} for the mentioned groups, were estimated by averaging the reported log K_{OW} values of the congeners associated with each group. For the rest of the alkylated groups, the log K_{OW} of the most available congener associated with the group was used. Log K_{OW} values were obtained from EPI software. As shown in Choi et al. (2013) (Supporting Information, Table 2), the log K_{OW} for the congeners under each alkylated group are not very different. The name of the congener for each log K_{OW} is mentioned as a comment on the cell. Log K_{OW} values for C3-fluorene, C3-chrysene, and C3-fluoranthene/pyrene were provided from different sources (as indicated in the spreadsheet), since they were not available in the software.

For alkylated PAHs, K_{PE-w} was estimated based on the correlation between log K_{PE-w} and log K_{OW} provided by Choi et al. (2013). This correlation was shown in Figure 3 (c) in the paper.

Log K_{PE-w} values were not corrected for temperature and salinity because the laboratory is maintained at approximately 25 degrees Celsius and salinity corrections on K_{PE-w} values are less than 1% (Lohmann 2011).

The risk assessment will address the uncertainty in the porewater concentration and the potential uncertainty in the various partitioning values in the literature.

trans-Nonachlor	Ochiai et al. (2011)

4. Quality assurance and quality control

The concentrations in field blanks were compared to concentrations in PE/POM exposed to sediment samples in order to check for contamination of the polymers from exposure to the laboratory or field atmosphere.

The concentration of all PCBs, PAHs, and dioxins/furans in field blanks were below the reporting limit of the respective analytical methods.

Five pesticides, trans-nonachlor, P,P'-DDE, hexachlorobenzene, beta-chlordane, and alpha-chlordane were detected in field blanks above the reporting limits. However, the total concentration of pesticides in field blanks was negligible compared to the total concentration in sediment samples (2-3 orders of magnitude smaller) as shown in the figure below.

The total concentration of pesticides in field blanks was negligible compared to the total concentration in sediment samples (2-3 orders of magnitude smaller).

A full report of the laboratory passive sampling program is being developed which will include the measurement of both organic and inorganic compounds in sediment porewater.

CASE NARRATIVE

SUBJECT: Tierra Solutions, Inc.: Newark Bay Benthic Macroinvertebrate Sample Analysis
Normandeau Associates, Inc. Project Number 23489.006/00/254
Revision 1 – 14 March 2017

Dear Bill:

During the period 7 October 2015 through 7 January 2016 Normandeau Associates, Inc. analyzed a set of 30 benthic macroinvertebrate samples with replicates, for a total of 90 samples, collected from the Newark Bay Study Area near Newark, New Jersey. The analysis was conducted to support Tierra Solutions, Inc. implementation of a Remedial Investigation and Feasibility Study.

Methodology

Collection

Samples were collected by Arcadis U.S., Inc. from bay sediments with Standard (sample area = 0.052 m²) and Petite (area = 0.023 m²) Ponar Grabs. The samples were taken during the period 13 through 29 September 2015. Geomorphic areas sampled included Intertidal Areas, Subtidal Flats and Transitional Slopes. Three replicate samples were collected from each of 30 sample locations and labelled: NB03SED-COM - 136 through 165. The samples were preserved in the field with alcohol and shipped to Normandeau's laboratories for processing (specimen removal) and taxonomic analysis. They were received on 30 September 2015.

Analysis

At the lab the sample matrices were processed in entirety to remove specimens from all phylogenetic groups, except for those within taxa that were particularly abundant (e.g., > 100). For these, all non-abundant taxa were first removed in entirety - and the matrices then placed into a Folsom Splitter. The matrices were divided into 1/2, 1/4, or 1/8 fractions and specimens from abundant taxa removed by randomly selecting and re-processing one of the fractions. The counts for abundant taxa were then estimated according to the amount of matrix re-processed. In addition, any non-abundant forms still

present were picked and subsequently used to calculate a Quality Assurance estimate for specimen removal.

All specimens were identified to the genus/species (lowest practicable) phylogenetic endpoint, given their age and condition, using dissection and compound microscopes.

Metrics calculated from the sample data were: Taxonomic Richness; Population and Community Density; and Shannon –Wiener Diversity. The results were submitted to Tierra as a data matrix and as report-ready data tables.

Quality Assurance/Quality Control

Quality Control pertaining to the efficiency of specimen removal was applied by randomly selecting and re-processing ten percent (9) of the matrices. The results were considered sufficient if 90.0 percent or more of both the taxa and specimens were removed during the initial effort. These are shown as follows:

<u>Sample / Rep.</u>	<u>Taxa Removal</u>	<u>Specimen Removal</u>
136 B	100.0 %	94.4%
140 B	100.0 %	100.0%
144 B	80.0 % (4 of 5)	88.9 % (8 of 9)
145 B	100.0 %	99.4 %
151 B	100.0 %	100.0 %
155 C	100.0 %	98.7 %
157 B	100.0 %	100.0 %
157 C	86.7 % (13 of 15)	93.0 %
165 A	100.0 %	97.2 %
Mean	96.6 %	96.8 %

Because sorting efficiency for two of the above samples (144B and 157C) fell below 90 percent for either taxa or specimen removal, a second sample processed by the same technician was selected for QA/QC analysis. These results were above 90 percent. For corrective action, the specimens obtained in the QA/QC process for samples 144B and 157C were added to those originally removed from the samples. The macroinvertebrate data reported for these two samples reflect this corrective action.

In addition, Quality Assurance estimates were calculated from re-processing the fractions that were sub-sampled:

<u>Sample / Rep.</u>	<u>Taxa Removal</u>	<u>Specimen Removal</u>
137 A	100.0 %	100.0%
137 B	100.0 %	100.0%
138 A	100.0 %	100.0 %
138 B	100.0 %	97.5 %
138 C	100.0 %	100.0 %
140 A	100.0 %	99.0 %
140 C	100.0 %	100.0 %
142 A	100.0 %	100.0 %
142 B	100.0 %	100.0 %
142 C	96.0 %	94.3%
143 B	100.0 %	99.4 %
143 C	100.0 %	99.4 %
145 C	100.0 %	99.7 %
147 A	100.0 %	100.0 %
152 B	100.0 %	100.0 %
154 A	100.0 %	100.0 %
158 A	100.0 %	98.9 %
158 C	100.0 %	98.8 %
159 A	100.0 %	98.0 %
162 C	100.0 %	100.0 %
163 A	90.9 %	97.3 %
164 A	100.0 %	100.0 %
164 B	100.0 %	95.7 %
164 C	100.0 %	98.3 %
165 B	100.0 %	98.8%
Mean	99.5 %	99.0 %

Taxonomic accuracy was verified through independent re-analyses of nine samples.

<u>Sample / Rep.</u>	<u>Identifications</u>	<u>Gross Count</u>
137 B	93.8 %	94.3 %
142 B	100.0 %	98.1 %
143 A	100.0 %	100.0 %
148 C	100.0 %	100.0 %
151 A	100.0 %	100.0 %
153 C	97.1 %	97.5 %
158 C	96.9 %	98.7 %
161 C	100.0 %	99.0 %
165 A	100.0 %	98.6 %
Mean	98.6 %	98.5 %

All sample tracking and quality control records are on file at Normandeau and available upon request. Laboratory Bench Sheets are also on file. Sample matrices and specimens will be retained at Normandeau for a period of three years.

Results

The analysis of 90 sample replicates produced a cumulative total of 106 taxa. The number of taxa identified from individual sample locations ranged between eight and 46, with a mean of 23 (n = 30).

The most abundant taxa (≥ 5.0 % of the total) at one or more stations were:

Annelida

<i>Alitta succinea</i>	<i>Laeonereis culveri</i>	<i>Pectinaria gouldii</i>
<i>Glycera americana</i>	<i>Leitoscoloplos fragilis</i>	<i>Spiochaetopterus costarum</i>
<i>Glycinde solitaria</i>	<i>Mediomastus ambiseta</i>	<i>Streblospio benedicti</i>
<i>Hypereteone heteropoda</i>	<i>Oligochaeta</i>	<i>Tharyx acutus</i>

Mollusca

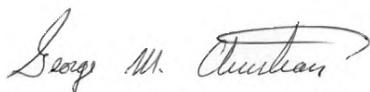

<i>Haminoea solitaria</i>	<i>Macoma balthica</i>	<i>Mya arenaria</i>
<i>Ilyanassa obsoleta</i>	<i>Mulinia lateralis</i>	

Arthropoda

<i>Ampelisca abdita</i>	<i>Grandidierella japonica</i>	<i>Microdeutopus gryllotalpa</i>
<i>Cyathura burbancki</i>	<i>Leucon americanus</i>	

Community Density calculations at particular stations produced values ranging between 406 and 11,237 individuals per square meter, with a mean of 4,771 (n = 30). Shannon-Wiener Diversity values ranged from 1.5 and 3.0 and the mean was 2.2 (n = 30).

Respectively Submitted,

George M. Christian
Senior Scientist/Laboratory Manager

CASE NARRATIVE

SUBJECT: Tierra Solutions, Inc.: Newark Bay Benthic Macroinvertebrate Sample Biomass
Normandeau Associates, Inc. Project Number 23489.008/688
Revision 2 – 10 April 2017

During the period 8 June 2016 through 20 June 2016 Normandeau Associates, Inc. measured Dry-Weight Biomass from a set of 30 benthic macroinvertebrate sample stations with replicates, for a total of 90 samples, collected September 2015 from the Newark Bay Study Area near Newark, New Jersey. The analysis was conducted to support Tierra Solutions, Inc. implementation of a Remedial Investigation and Feasibility Study.

Collection

Samples had been collected by Arcadis U.S., Inc. from bay sediments with Standard (sample area = 0.052 m²) and Petite (area = 0.023 m²) Ponar Grabs. The samples were taken during the period 13 through 29 September 2015. Geomorphic areas sampled included Intertidal Areas, Subtidal Flats and Transitional Slopes. Three replicate samples were collected from each of 30 sample locations and labelled: NB03SED-COM - 136 through 165. The samples were preserved in the field with alcohol, shipped to Normandeau's laboratory for taxonomic analysis and subsequent Dry-Weight Biomass determination.

Analysis and Quality Control

Biomass was determined for each sample as dry weight (shell free), following the procedures in Standard Methods for the Examination of Water and Wastewater: Method 209 A – Total Residue Dried at 103-105 C (APHA, AWWA, and WPCF 1980). All specimens from applicable phyla were included in each sample weight. Shelled organisms (ie. mollusks) had the tissue removed; shells were not included in the dry weight. All mollusk tissue was weighed, no subsampling occurred. Samples were weighed to 0.0001 grams using a Sartorius analytical balance (serviced and calibrated on 3 May 2016).

A. Tare Weight was determined for each tray and recorded to 0.0001 grams. Samples were prepared by removing as much 70% ETOH as is reasonable, placing all phyla organisms from the sample into a tared aluminum tray. The aluminum tray identifier was recorded along with sample control number on the biomass form. Samples were dried in the oven at 103-105 C for 1.0 hour, transferred in batches to the desiccator and allowed to cool for 5 minutes. Dry weight was calculated as the weight of the dried material and tray minus the tare weight of the tray.

The following procedure was used to determine that samples were completely dried. Weights were obtained for one of every four samples on the Sartorius analytical balance to 0.0001g from each batch and recorded in the dry weight column (Wt1) of the biomass form. Samples with the larger amount of material were selected to ensure checking the sample least likely to have thoroughly dried. Samples were returned to the drying oven and dried for another 1.0 hour. Samples were then transferred to the desiccator and those previously pre-selected trays were re-weighed. Weights were recorded in the dry weight column (Wt2) of the biomass form.

The difference between the first and second weighings was calculated using the following formula. An acceptable difference of less than 5% or less than 0.001 grams between weighings, an in-house criterion more stringent than the required criterion (less than 5% or less than 0.004 grams) contained in the Standard Methods procedure, indicated complete drying. If acceptable, all samples in the batch were weighed and recorded. If not, the steps were repeated until the difference was acceptable for all selected re-weights in the batch. All samples (26 samples) checked at the Wt2 check point confirmed adequate dryness.

$$\frac{(1^{\text{st}} \text{ Dry Weight}) - (2^{\text{nd}} \text{ Dry Weight})}{2^{\text{nd}} \text{ Dry Weight}} \times 100 = \% \text{ Difference}$$

Results (n = 26)	
Range	% Difference
Lowest	0.00
Highest	1.49

B. Blank tray weight analysis is performed to ensure that there is no additional source of contamination to the process. The precision criterion stipulated in *Standard Methods for the Examination of Water and Wastewater* (pg. 92-93) of “a difference of less than 5% or less than 0.004 grams” is the recommended guideline to be followed when conducting checks between initial and final sample weights and blank tray weights. However, a more stringent acceptable difference of 0.0009 grams between initial and final blank weights is used by Normandeau. This criterion represents the mean plus two standard deviations of observed differences in previous projects in Normandeau’s laboratory. A total of 6 blanks were measured and all weight results were acceptable.

Results	
Tray #	Difference in Weight (grams)
27	.0006
44	.0002
132	.0001
190	.0008
409	.0006
432	.0007

C. Quality control pertaining to the efficiency and consistency of the technicians was conducted by randomly selecting, re-wetting and re-weighing ten percent of the samples. Results were calculated using the following formula and were considered acceptable if the difference between the original weight and the QC weight was not more than 5% or 0.001 grams (for very small amounts of material). All Quality Control checks were acceptable.

$$\frac{(2^{\text{nd}} \text{ Dry Weight}) - (2^{\text{nd}} \text{ QC Dry Weight})}{2^{\text{nd}} \text{ QC Dry Weight}} \times 100 = \%$$

Results	
Samples/Rep.	% Difference
138 B	0.90
141 C	0.29
143 C	0.69
146 C	0.31
148 A	1.35
151 C	1.09
155 A	1.85

158 C	2.22
159 B	0.43
162 C	<0.001 grams*
164 B	0.10

*Sample 162 C consisted of such a small amount of material that the acceptance criteria of less than 0.001 grams noted above, applies.

All sample tracking and quality control records are on file at Normandeau and available upon request. Laboratory bench sheets are also on file. Sample material that has been biomassed will be retained at Normandeau until acceptance of the report, at which time we will seek permission to dispose of the material.

¹ All samples collected with a Petite Ponar Grab (0.023 square meter) except Stations 142, 146, 149, 152, 154, 155, 158, 159, and 160 which were collected with a Standard Ponar Grab (0.052 square meter).

² Dry Weight Biomass of Benthic Macroinvertebrates per square meter of Newark Bay bottom.

Appendix E

Data Qualifier Definitions

Data Qualifier	Definition
B	The analyte is present in the associated method blank as well as in the sample. This qualifier has a different meaning when validating inorganic data.
C	This flag applies to Aroclors results when the identification has been confirmed by GC/MS analysis.
D	The positive value is the result of an analysis at a secondary dilution factor.
E	The concentration of this analyte exceeds the calibration range of the instrument.
I	The laboratory indicated the presence of an interference during the sample analysis.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J-	The result is an estimated quantity, but the result may be biased low.
J+	The result is an estimated quantity, but the result may be biased high.
JH	The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential high bias, of the analyte in the sample.
JL	The analyte was positively identified; but the associated numerical value is the approximate concentration, with a potential low bias, of the analyte in the sample.
JN	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
M	The analytical result reported was obtained from a sediment sample found to contain between 50 and 90 percent moisture and had no other data qualifiers added during the data validating process.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
NJH	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration with a potential high bias, of the analyte concentration.
P	Aroclor target analytes when the % difference between the analyte concentrations obtained from the two dissimilar GC columns is greater than 25%.
Q	Estimated maximum possible concentration.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.
S	Single point calibration.
T	Applied only to calculated totals in which the results of one or more individual analytes that make up the given total are rejected.
U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
UJL	The analyte was not detected and the reported sample quantitation limit is biased low.
UJH	The analyte was not detected and the reported sample quantitation limit is biased high.
Z	Data validated but no qualifiers applicable.

Table E-1
Surface Sediment Analytical Results

Notes:

1. Totals were calculated using detected values only. If all analytes that make up a given total are nondetect, the total will be reported as the highest detection limit of the individual analytes and will be qualified with a "U" flag to indicate it is a non-detect.
2. Total PCB Congeners (209) = sum of 209 individual congener PCBs
3. Total Aroclor PCBs (Sum of 7 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260
4. Total Aroclor PCBs (Sum of 9 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, Aroclor-1260, Aroclor-1262, and Aroclor-1268
5. Total Alpha + Gamma Chlordane = sum of alpha-Chlordane and gamma-Chlordane
6. Total DDT (2,4) = sum of 2,4'-DDD, 2,4'-DDE, and 2,4'-DDT
7. Total DDT (4,4) = sum of 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
8. Total DDT (2,4 & 4,4) = sum of 2,4'-DDD, 2,4'-DDE, 2,4'-DDT, 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
9. Total HMW PAHs = sum of fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene.
10. Total LMW PAHs = sum of naphthalene, 2-methylnaphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, and anthracene.
11. Total PAHs = sum of Total LMW PAHs and Total HMW PAHs.
12. C1-Naphthalenes = sum of 1-methylnaphthalene and 2-methylnaphthalene

ASTM = American Society for Testing Materials

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HMW = high molecular weight

LMW = low molecular weight

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

TCDD = tetrachlorodibenzo-p-dioxin

TEPH = total extractable petroleum hydrocarbons

% = percent

mg/kg = milligrams per kilogram

ng/g = nanograms per gram

ng/kg = nanograms per kilogram

pg/g = picograms per gram

ppb = parts per billion

ug/kg = micrograms per kilogram

Table E-2
Bioaccumulation Tissue (Polychaete) Analytical Results

Notes:

1. Totals were calculated using detected values only. If all analytes that make up a given total are nondetect, the total will be reported as the highest detection limit of the individual analytes and will be qualified with a "U" flag to indicate it is a non-detect.
2. Total PCB Congeners (209) = sum of 209 individual congener PCBs
3. Total Aroclor PCBs (Sum of 7 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260
4. Total Aroclor PCBs (Sum of 9 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, Aroclor-1260, Aroclor-1262, and Aroclor-1268
5. Total Alpha + Gamma Chlordane = sum of alpha-Chlordane and gamma-Chlordane
6. Total DDT (2,4) = sum of 2,4'-DDD, 2,4'-DDE, and 2,4'-DDT
7. Total DDT (4,4) = sum of 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
8. Total DDT (2,4 & 4,4) = sum of 2,4'-DDD, 2,4'-DDE, 2,4'-DDT, 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
9. Total HMW PAHs = sum of fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene.
10. Total LMW PAHs = sum of naphthalene, 2-methylnaphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, and anthracene.
11. Total PAHs = sum of Total LMW PAHs and Total HMW PAHs.
12. C1-Naphthalenes = sum of 1-methylnaphthalene and 2-methylnaphthalene

ASTM = American Society for Testing Materials

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HMW = high molecular weight

LMW = low molecular weight

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

TCDD = tetrachlorodibenzo-p-dioxin

% = percent

mg/kg = milligrams per kilogram

ng/g = nanograms per gram

ng/kg = nanograms per kilogram

pg/g = picograms per gram

ug/kg = micrograms per kilogram

Table E-3
Porewater Analytical Results

Footnotes:

¹ While removing the dialysis bags from the sediment in the 5-gallon bucket in the laboratory for Location 155, one of the dialysis bags broke and the contents were lost. As such, there was not enough sample volume in the remaining dialysis bag to run all of the inorganics analyses. It was decided that samples would only be sent for analysis of total sulfide, mercury, and methylmercury for this sample.

Notes:

1. Totals were calculated using detected values only. If all analytes that make up a given total are nondetect, the total will be reported as the highest detection limit of the individual analytes and will be qualified with a "U" flag to indicate it is a non-detect.
2. Total PCB Congeners (209) = sum of 209 individual congener PCBs
3. Total Aroclor PCBs (Sum of 7 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, and Aroclor-1260
4. Total Aroclor PCBs (Sum of 9 Aroclors) = sum of Aroclor-1016, Aroclor-1221, Aroclor-1232, Aroclor-1242, Aroclor-1248, Aroclor-1254, Aroclor-1260, Aroclor-1262, and Aroclor-1268
5. Total Alpha + Gamma Chlordane = sum of alpha-Chlordane and gamma-Chlordane
6. Total DDT (2,4) = sum of 2,4'-DDD, 2,4'-DDE, and 2,4'-DDT
7. Total DDT (4,4) = sum of 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
8. Total DDT (2,4 & 4,4) = sum of 2,4'-DDD, 2,4'-DDE, 2,4'-DDT, 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT
9. Total HMW PAHs = sum of fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene.
10. Total LMW PAHs = sum of naphthalene, 2-methylnaphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, and anthracene.
11. Total PAHs = sum of Total LMW PAHs and Total HMW PAHs.
12. C1-Naphthalenes = sum of 1-methylnaphthalene and 2-methylnaphthalene

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HMW = high molecular weight

LMW = low molecular weight

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

ng/L = nanograms per liter

pg/l = picograms per liter

1.0 INTRODUCTION

In 2015 the United States Environmental Protection Agency (USEPA) approved a Quality Assurance Project Plan (QAPP) prepared by Tierra Solutions, Inc. (Tierra) for the sampling and analysis of sediment quality triad (SQT) and porewater in the Newark Bay Study Area. The Sediment Quality Triad and Porewater Sampling and Analysis QAPP, Revision 2 (Tierra 2015) (hereafter referred to as the QAPP) outlined the SQT and porewater sampling and analyses to be conducted for the baseline human health and ecological risk assessment.

The SQT activities consisted of the collection and analysis of 30 porewater samples (plus two field duplicates), 43 sediment samples (plus three field duplicates), and 8 tissue samples (plus one field duplicate). According to Worksheet #37 of the QAPP (Tierra 2015), a Data Quality Usability Assessment Report (DQUAR) must be completed after the conclusion of validation tasks.

In accordance with requirements of the QAPP, the data quality usability assessment was conducted on both verified and validated data; this DQUAR provides a summary of the evaluation of data quality and usability for sample data collected during implementation of the SQT QAPP. The data verification and data validation processes are described respectively in Worksheets #34 and #35 of the QAPP.

Worksheet #37 of the QAPP provides a description of the components of the DQUAR. These components are described in detail in subsequent sections of this report.

2.0 DATA QUALITY PARAMETERS OVERVIEW

To assess whether the analytical data obtained were consistent with the objectives of the QAPP, seven data quality parameters were evaluated. In the event that the data verification/validation process identified an instance where any of the data quality parameters did not meet the objectives established in the QAPP, the affected sample results were evaluated in accordance with the data verification/validation protocols specified in Worksheets #34 and #35 of the QAPP and documented accordingly. A detailed narrative describing the verification/validation assessments and findings can be found within the data verification/validation data assessment narratives prepared for each data package.

The seven data quality parameters assessed included the following:

- precision;
- accuracy/bias contamination;
- overall accuracy/bias;
- sensitivity;
- representativeness;
- comparability; and
- completeness.

Each of these data quality parameters, as it relates to the QAPP, is discussed below.

2.1 PRECISION

Precision is the measure of variability between individual sample measurements of the same property under similar conditions. During the SQT program, precision was evaluated through the analysis of two types of duplicate samples. Field and laboratory duplicates were analyzed at regular, specified intervals throughout the SQT program.

Field duplicates consisted of samples that were collected in the field at the frequency specified in the QAPP in order to determine the precision of field sampling methods. For porewater samples, co-located samples were collected as two distinct samples, and submitted “blind” to the analytical laboratories for analysis (i.e., the sample identification did not reveal the sample with which its field duplicate was associated). For sediment samples, two aliquots of material were taken from the same composited and homogenized sediment material and shipped “blind” to the laboratory. For tissue samples, the tissue was exposed to the same composited and homogenized sediment material in separate test chambers and then submitted “blind” to the laboratory. Although the requirement for a tissue field duplicate was not included in Worksheet #12-3, a tissue field duplicate was included in Worksheet #20-4.

Relative percent differences (RPDs) between the field sample results and the field duplicate results provide an estimate of the overall sampling and analytical precision.

Laboratory duplicates are two portions of a single homogeneous sample that are analyzed for the same parameter in order to determine the precision of the analytical system. Two types of laboratory

duplicates were prepared. Laboratory duplicates without known analyte spikes added were analyzed to monitor laboratory precision for inorganics, while matrix spike (MS) and matrix spike duplicate (MSD) evaluations were performed to monitor laboratory precision for the remaining analysis types. Laboratory duplicates were analyzed at the frequency specified in QAPP. The RPD between results obtained for a given laboratory duplicate pair provides an estimate of analytical precision.

The precision assessment for field and laboratory duplicate analyses is expressed as the RPD:

$$\text{RPD} = \{(S-D)/(S+D)/2\} \times 100$$

Where:

S = original sample concentration

D = duplicate sample concentration

Acceptance criteria for field and laboratory duplicates are provided in Worksheets #12-2 through #12-4 of the QAPP. Conformance to laboratory duplicate frequency requirements, as well as acceptability of the resulting RPD values, were evaluated and considered during data validation.

Although laboratory duplicate analyses are used as indicators of relative precision of the analytical systems, the degree of homogeneity of the contaminants in the sample medium can also affect the reproducibility of a particular measurement. For example, pieces of decayed wood debris, chunks of asphalt, glass, free product, etc., can increase sample heterogeneity and therefore can reduce the laboratory technician's ability to create homogeneous duplicate samples with which to measure precision. Since the sample matrix characteristics can affect the way precision is measured, the sample matrix should be considered by the validator.

With respect to the results of the SQT data, there are no limitations on data usage based on precision quality acceptance criteria. The following table summarizes the precision quality evaluation by analytical group and sample type. The "x" designation indicates that an issue was identified; however, such an issue does not infer that the data are unusable. A more detailed discussion of this data quality parameter evaluation is provided in Section 3.1 of this report.

PRECISION

 v = no data qualifications due to precision were made for this analytical group

2.2 ACCURACY/BIAS CONTAMINATION

Accuracy parameters were also assessed with respect to contamination through the use of field and laboratory blanks. Any contamination present in field or laboratory blanks reflects the potential for contamination in associated samples. Measurement performance criteria for accuracy/bias contamination are outlined in Worksheets #12-1 through #12-4 of the QAPP. Acceptability of quality control (QC) results for accuracy/bias contamination and conformance to field and laboratory QC sample frequency requirements were evaluated and considered during the data verification/validation.

With respect to the results of the SQT data, there are no limitations on the data usage based on accuracy/bias contamination acceptance criteria. The following table summarizes the accuracy/bias

contamination quality evaluation by analytical group and sample type. The “x” designation indicates that an issue was identified; however, such an issue does not infer that the data are unusable. A more detailed discussion of this data quality parameter evaluation is provided in Section 3.1 of this report.

2.3 OVERALL ACCURACY/BIAS

Accuracy is a measure of the bias and precision in a system, and is defined as the agreement between a measurement and an accepted reference or true value. Pre-mobilization performance evaluation samples were analyzed prior to initiating field work. Documentation of successful analysis of the performance evaluation samples was provided to the USEPA by Tierra. Accuracy was monitored during the SQT program through the analysis of MSs, surrogate spikes, and laboratory control samples (LCSs) (performed at regular, specified intervals).

As outlined in the QAPP, the analysis of MS samples and LCSs provide laboratory results that may be compared to their associated known values to monitor potential bias. The MS and surrogate spike evaluations were used to assess bias by monitoring the actual recovery of a known quantity of a chemical, added to the native sample, versus the expected recovery. The LCS evaluations were used to assess bias by monitoring the actual recovery of a known quantity of a chemical, added to a blank, versus the expected recovery.

Acceptance criteria for each of the accuracy evaluations described above are provided in Worksheets #12-1 through #12-4 of the QAPP. Conformance to laboratory QC sample frequency requirements, as well as acceptability of QC results for accuracy, were evaluated and considered during data verification/validation.

Data for several analytical groups associated with multiple sample types were determined to be unusable due to severe accuracy/bias issues. The following table summarizes the overall accuracy/bias quality evaluation by analytical group and sample type. The “x” designation indicates that an issue was identified; however, such an issue does not infer that the data are unusable. A more detailed discussion of this data quality parameter evaluation is provided in Section 3.1 of this report.

v = no data qualifications due to overall accuracy/bias were made for this analytical group

2.4 SENSITIVITY

Sensitivity is related to the ability to compare analytical results with project quantitation limits (PQLs). Analytical detection limits should be at or below the PQLs to allow effective comparisons. The QAPP PQLs were set equal to the laboratory achievable quantitation limit, and any dilution or adjustment in initial extraction mass by the laboratory would cause the quantitation limit to be higher than the achievable quantitation limit. All sample analytical results reported during the SQT program were evaluated to determine if adequate sensitivity was achieved. The results for each analyte were cross-checked against the PQLs presented in Worksheets #15-1 to #15-4 of the QAPP. The tables in Section 2.4.1 below summarize the percent of sample results that did not meet the data quality objectives as defined by the QAPP. The percentages expressed in these tables indicate the fraction of the total number of results reported for each analytical group and sample type where reporting limits exceeded the PQLs.

With respect to the results of the SQT data, there are no limitations on the data usage based on sensitivity acceptance criteria. A more detailed discussion of this data quality parameter evaluation is provided in Section 2.4.1.

2.4.1 Achieved Analytical Sensitivity

The fact that data obtained for a particular sample type failed to meet established PQLs for specific analytical groups as indicated in the tables below, may have impacted the number of positive results identified in those samples, thereby potentially impacting the data evaluation process. Following each table is a discussion of the analytical groups for which failure to meet the PQLs may have impacted the data evaluation.

Porewater

**Table 2-1
 Sensitivity Quality Evaluation for Porewater Samples**

Analytical Group	Total Number of Results Reported	Non-detected Results with PQLs Greater than those Defined in the SQT QAPP	Detected Results Between the MDL (or EDL where appropriate) and Elevated PQL	Total Non-detect Results	Total Non-detect Results Greater than PQL / Total Results Reported
Organochlorine Pesticides	925	482	17	495	482/925
Semivolatile Organics (SIM)	1216	243	71	500	243/1216
Metals	682	246	99	375	246/682
Titanium	31	0	27	8	0/31
Mercury	32	1	0	1	1/32
Methylmercury	32	0	0	0	0/32
Sulfide	32	0	0	0	0/32
PCDDs/PCDFs	544	3	439	4	3/544
PCB Congeners	5376	605	329	605	605/5376
DOC	30	0	0	0	0/30
Ammonia Nitrogen	30	0	2	0	0/30

For the porewater results, PQLs identified in Table 2-1 above as greater than those defined in the QAPP were exceeded to varying degrees, mainly due to either sample dilution prior to analysis, or use of less than targeted sample volume for analysis.

Sediment

**Table 2-2
 Sensitivity Quality Evaluation for Sediment Samples**

Analytical Group	Total Number of Results Reported	Non-detected Results with PQLs Greater than those	Detected Results Between the MDL (or EDL where appropriate) and Elevated PQL	Total Non-detect Results	Total Non-detect Results Greater than PQL / Total Results Reported
Semivolatile Organics	2438	2291	82	2301	2291/2438
Volatile Organics	184	8	1	183	8/184
Aroclor PCBs	414	45	28	294	45/414
Butyltins	184	170	0	170	170/184

Acid Volatile Sulfide	46	0	7	2	0/46
Total Kjeldahl Nitrogen	46	0	2	0	0/46
Chlorinated Herbicides	184	36	6	170	36/184
Ammonia Nitrogen	46	31	13	31	31/46

For the sediment results, PQLs identified in Table 2-2 above as greater than those defined in the QAPP were exceeded to varying degrees, mainly due to either sample dilution prior to analysis, or use of less than targeted sample volume for analysis.

Tissue

**Table 2-3
 Sensitivity Quality Evaluation for Tissue Samples**

Analytical Group	Total Number of Results Reported	Non-detected Results with PQLs Greater than those	Detected Results Between the MDL (or EDL where appropriate) and Elevated PQL	Total Non-detect Results	Total Non-detect Results Greater than PQL / Total Results Reported
Semivolatile Organics	477	476	1	476	476/477
Aroclor PCBs	81	0	3	62	0/81
Butyltins	36	0	0	36	0/36
Organochlorine Pesticides	1512	0	83	145	0/1512
Semivolatile Organics (SIM)	342	170	11	326	170/342
Metals	198	0	35	63	0/198
Titanium	9	0	7	0	0/9
Mercury	9	0	0	0	0/9
Methylmercury	9	0	0	0	0/9
PCDDs/PCDFs	153	0	118	6	0/153
PCB Congeners	261	12	16	218	12/261

For the tissue results, PQLs identified in Table 2-3 above as greater than those defined in the QAPP were exceeded to varying degrees, mainly due to either sample dilution prior to analysis, or use of less than targeted sample volume for analysis.

2.5 REPRESENTATIVENESS

Representativeness is the degree to which a dataset accurately represents the characteristics of a population, parameter conditions at a sample point, or an environmental condition. Data are representative when all sampling and analyses are performed in compliance with appropriate procedures. Performing sample analyses within the specified holding times and adhering to sample handling and storage requirements are also critical elements in obtaining representative sample data. These elements were evaluated and considered during data verification/validation. Acceptance criteria for sample handling, storage and holding times are provided in Worksheets #19-1 through #19-4 of the QAPP.

With respect to the results of the SQT data, there are no limitations on the data usage based on representativeness acceptance criteria. The following table summarizes the representativeness quality evaluation by analytical group and sample type. The “x” designation indicates that an issue was identified; however, such an issue does not infer that the data are unusable. Data were qualified for representativeness due to holding time violations. A more detailed discussion of this data quality parameter evaluation is provided in Section 3.1 of this report.

Holding Time Violations			
Analytical Groups	Porewater	Sediment	Tissue

Grain Size	-	v	-

- = analysis was not performed for this analytical group
 x = data qualified due to holding time violations during validation for this analytical group
 v = no data qualifications due to holding time violations were made for this analytical group

2.6 COMPARABILITY

Comparability expresses the confidence with which one set of data can be compared to another to measure the same property. Data can be compared to the degree that their accuracy, precision, and representativeness are known and documented. Data are comparable if QC measures such as collection techniques, measurement procedures, analytical methods, and reporting units are equivalent for the samples within a sample set. Data subject to established quality assurance/quality control (QA/QC) measures are deemed more reliable and, therefore, more comparable, than data generated without such measures.

Consistent application of prescribed procedures was monitored throughout the SQT program. Likewise, specific data verification/validation protocols were consistently applied to all data generated

under this program to understand and document accuracy/bias, accuracy/bias contamination, precision, sensitivity and representativeness, thereby establishing comparability as defined above.

During data validation activities, analytical data were evaluated using a defined set of guidelines and acceptance criteria. In addition, data validation qualifiers were consistently applied to the analytical data generated during the SQT program. The data validation process serves to increase the degree of data comparability achieved.

With respect to the results of the SQT data, there are no limitations on the data usage based on comparability acceptance criteria.

2.7 FIELD AND ANALYTICAL COMPLETENESS

There are two measures of completeness defined for the SQT program: field completeness and analytical completeness. Field completeness is defined as the ratio of the number of samples received in acceptable condition by the laboratories to the number of samples planned to be collected as specified in the QAPP. Analytical completeness is defined as the ratio of total analytical data results reported to the total number of analytical results requested on samples submitted for analysis. Rejected results are not included in the total valid analytical data. The formulas used to compute field and analytical completeness are presented below.

$$\% \text{ Field Completeness} = (\text{Number of Samples [field samples and field duplicates] Received by Laboratories} / \text{Total Number of Samples [field samples and field duplicates] Planned to be Collected}) \times 100$$

$$\% \text{ Analytical Completeness} = (\text{Total Valid Analytical Data} / \text{Analytical Data Obtained}) \times 100$$

The targeted field and analytical completeness goals were 90% for the SQT program; these goals were met, or exceeded, as summarized below.

SQT Completeness	Completeness Goal Established in SQT QAPP	SQT Completeness Achieved
Field Completeness (Overall)	90%	99.9%
Analytical Completeness (Overall)	90%	96.4%

SQT Field Completeness by Analysis and Sample Type

Analytical Group	Number of Samples Collected by Sample Type			Total Number of Samples Collected	Total Number of Samples Planned	Completeness Achieved (%)
	Porewater	Sediment	Tissue

Metals and titanium were unable to be analyzed for NB03SED-POR155 due to an insufficient sample volume. While removing the dialysis bags from the sediment in the 5-gallon bucket in the laboratory for Location 155, one of the dialysis bags broke and the contents were lost. As such, there was not enough volume in the remaining dialysis bag to run all of the inorganics analyses.

The total analytical completeness was obtained using the total sample results for porewater, sediment, and tissue minus the total amount of rejected results. The laboratory completed all analyses but some data were rejected, causing the overall analytical completeness to be 96.4%. The analytical completeness achieved for porewater samples was 99.0%. The analytical completeness achieved for sediment samples was 95.1%. The analytical completeness for tissue samples was 97.5%. The total analytical completeness for all matrices analyzed is 96.4%.

3.0 SQT DATA VERIFICATION/VALIDATION

SQT analytical results were provided by the laboratories both electronically and in hard copy format. Upon receipt from the laboratory, results for specific analytical groups described below were verified or validated by Field and Technical Services, LLC. (FTS) using the following procedures:

Semivolatile Organics	USEPA Region 2 SOP HW-22, Revision 3, 10/06

The verification/validation standard operating procedures (SOPs), as referenced above, are provided in Appendix E of the QAPP. The data verification/validation process is detailed in Worksheets #34, #35, and #36 of the QAPP.

3.1 DATA QUALITY ISSUES

Two types of data quality issues are discussed in this section; systematic data quality issues and random data quality issues. Systematic data quality issues are those that are identified as having a consistent impact on the quality of results reported (i.e., data quality of all samples and/or analytical groups are affected by a single data quality issue), due to a common circumstance or procedural application. Systematic data quality issues are described in Section 3.1.1 as well as incorporated into Section 3.1.2. Random data quality issues are those that do not have a consistent impact on the quality of results (i.e., data quality for a specific sample(s) and/or analyte(s) are affected by the data quality issue). Random data quality issues are presented in Sections 3.1.2.

Section 3.1.2 summarizes the data validation findings related to systematic and random data quality issues for each analytical group. These validation findings have been separated into two distinct categories, major data quality issues and minor data quality issues. Major data quality issues are those that result in the qualification of the analytical value reported as “R”, or rejected. This occurs due to the presence of significant QA/QC problems that render the analysis invalid and the results unusable. Minor data quality issues include all other QA/QC problems identified during the data validation process that require sample results to be qualified, indicating some level of uncertainty associated with the reported result.

Conclusions based on the information presented in these summaries can be found in Section 4 of this report.

3.1.1 Porewater, Sediment, and Tissue Samples Systematic Data Quality Issues

Three systematic data quality issues were identified during the SQT porewater, sediment, and tissue sample validation task. These systematic data quality issues are summarized below:

- All organochlorine pesticide porewater hold times were exceeded and all porewater pesticides results were qualified as estimated.
- All mercury sediment hold times were exceeded and all sediment mercury results were qualified as estimated.
- All methylmercury porewater hold times were exceeded and all porewater methylmercury results were qualified as estimated.

3.1.2 Porewater, Sediment, and Tissue Samples Data Quality Issues by Analytical Group

Semivolatile Organic Compounds (SVOCs)

The SQT sediment sample SVOC dataset is comprised of 46 samples with 2438 associated results and tissue sample SVOC dataset is comprised of 9 samples with 477 associated results. A total of 407 sediment sample results from the SVOC analyses were rejected due to holding times.

One major data quality issue was identified during validation of the SQT SVOC analyses. The identified major data quality issue is described in the table below.

Five minor data quality issues were identified in the SQT SVOC dataset. The identified minor data quality issues are described in the table below.

Major Data Quality Issues					
Semivolatile Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of SVOC Results Affected
Non-compliant holding time	Representativeness	2438	8	407	16.7

Minor Data Quality Issues					
Semivolatile Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of SVOC Results Affected
Non-compliant field duplicate relative percent difference	Precision	2438	6	8	0.33
Laboratory blank contamination	Accuracy/Bias Contamination	2438	8	12	0.49
Field blank contamination	Accuracy/Bias Contamination	2438	1	1	0.04
Non-compliant percent moisture	Overall Accuracy/Bias	2438	15	795	32.6
Non-compliant holding time	Representativeness	2438	7	17	0.70

As shown in the table above for major data quality issues, 407 SVOC results were rejected due to holding time. Holding times that resulted in major data quality issues (rejected) were extracted or analyzed 2X outside of the holding time.

Volatile Organic Compounds (VOCs)

The SQT sediment VOC dataset is comprised of 46 samples with 184 associated results.

No major data quality issues were identified during validation of the SQT VOC analyses.

Three minor data quality issues were identified during validation of the SQT VOC analyses. The identified minor data quality issues are described in the table below.

Minor Data Quality Issues					
VOC Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of VOC Results Affected
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	184	3	3	1.63
Non-compliant internal standard recovery	Overall Accuracy/Bias	184	2	8	4.35
Non-compliant percent moisture	Overall Accuracy/Bias	184	11	44	23.9

Aroclor Polychlorinated Biphenyls (PCBs)

The SQT sediment Aroclor PCB dataset is comprised of 46 samples with 414 associated results and tissue Aroclor PCB dataset is comprised of 9 samples with 81 associated results.

No major data quality issues were identified during validation of the SQT Aroclor PCB analyses.

Two minor data quality issues were identified during validation of the SQT Aroclor PCB analyses. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
Aroclor PCBs Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Aroclor PCB Results Affected
Non-compliant aroclor identification percent difference	Precision	414	10	20	4.83
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	414	1	1	0.24

Minor Data Quality Issues					
Aroclor PCBs Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Aroclor PCB Results Affected
Non-compliant aroclor identification percent difference	Precision	81	7	8	9.88

Butyltins

The SQT sediment Butyltins dataset is comprised of 46 samples with 184 associated results and tissue Butyltins dataset is comprised of 9 samples with 36 associated results.

No major data quality issues were identified during validation of the SQT Butyltins analyses.

Two minor data quality issues were identified in the SQT sediment Butyltins dataset. The identified minor data quality issues are described in the table below.

Minor Data Quality Issues					
Butyltins Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Butyltins Results Affected
Non-compliant initial calibration regression coefficient	Overall Accuracy/Bias	184	3	3	1.63
Non-compliant percent moisture	Overall Accuracy/Bias	184	25	100	54.3

Organochlorine Pesticides

The SQT porewater Organochlorine Pesticide dataset is comprised of 32 samples with 925 associated results, sediment Organochlorine Pesticide dataset is comprised of 46 samples with 1334 associated results, and tissue Organochlorine Pesticide dataset is comprised of 9 samples with 261 associated results. A total of ten porewater sample results from the Organochlorine Pesticide analyses were

rejected due to surrogate recoveries. A total of 68 sediment sample results from the Organochlorine Pesticide analyses were rejected due to surrogate recoveries. A total of 17 tissue sample results from the Organochlorine Pesticide analyses were rejected due to surrogate recoveries.

One major data quality issue was identified during validation of the SQT Organochlorine Pesticide analyses. The identified major data quality issue is described in the tables below.

Ten minor data quality issues were identified in the SQT Organochlorine Pesticide dataset. The identified minor data quality issues are described in the tables below.

Major Data Quality Issues					
Organochlorine Pesticide Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	925	6	10	1.08

Major Data Quality Issues					
Organochlorine Pesticide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	1334	33	68	5.10

Major Data Quality Issues					
Organochlorine Pesticide Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	261	8	17	6.51

Minor Data Quality Issues					
Organochlorine Pesticide Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant field duplicate relative percent difference	Precision	925	2	2	0.22
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	925	2	10	1.08

Field blank contamination	Accuracy/Bias Contamination	925	16	17	1.84
Non-compliant identification relative abundance criteria	Overall Accuracy/Bias	925	13	13	1.41
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	925	2	9	0.97
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	925	16	22	2.38
Non-compliant holding time	Representativeness	925	925	32	100

Minor Data Quality Issues					
Organochlorine Pesticide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	1334	3	20	1.50
Non-compliant field duplicate relative percent difference	Precision	1334	6	14	1.05
Field blank contamination	Accuracy/Bias Contamination	1334	22	48	3.60
Non-compliant identification relative abundance criteria	Overall Accuracy/Bias	1334	23	23	1.72
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1334	3	25	1.87
Non-compliant internal standard recovery	Overall Accuracy/Bias	1334	5	7	0.52
Non-compliant signal to noise ratio	Overall Accuracy/Bias /Bias	1334	2	2	0.15
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	1334	23	49	3.67
Non-compliant holding time	Representativeness	1334	18	522	39.1

Minor Data Quality Issues					
Organochlorine Pesticide Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Organochlorine Pesticide Results Affected
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	261	1	1	0.38
Laboratory blank	Accuracy/Bias	261	2	2	0.77

contamination	Contamination				
Non-compliant identification relative abundance criteria	Overall Accuracy/Bias	261	4	4	1.53
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	261	1	2	0.77
Non-compliant internal standard recovery	Overall Accuracy/Bias	261	2	2	0.77
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	261	4	7	2.68

As shown in the tables above for major data quality issues, 95 Organochlorine Pesticide results were rejected due to surrogate recovery. Surrogate recoveries that resulted in major data quality issues (rejected) fell below 10% recovery. Surrogate recoveries that also resulted in major data quality issues (rejected) were surrogate recoveries below 25% with the associated result not detected.

Saturated Hydrocarbons

The SQT sediment Saturated Hydrocarbons dataset is comprised of 46 samples with 1610 associated results. A total of 34 sediment samples results from the Saturated Hydrocarbon analyses were rejected due to holding times.

One major data quality issue was identified during validation of the SQT Saturated Hydrocarbons analyses. The identified major data quality issue is described in the table below.

Seven minor data quality issues were identified in the SQT sediment Saturated Hydrocarbons dataset. The identified minor data quality issues are described in the table below.

Major Data Quality Issues					
Saturated Hydrocarbons Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Saturated Hydrocarbon Results Affected
Non-compliant holding time	Representativeness	1610	1	34	2.11

Minor Data Quality Issues					
Saturated Hydrocarbons Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Saturated Hydrocarbon Results Affected
Non-compliant field duplicate relative percent difference	Precision	1610	6	28	1.74
Laboratory blank contamination	Accuracy/Bias Contamination	1610	7	7	0.43
Non-compliant continuing calibration percent difference	Overall Accuracy/Bias	1610	17	17	1.06
Non-compliant laboratory control standard recovery	Overall Accuracy/Bias	1610	46	414	25.7
Non-compliant percent moisture	Overall Accuracy/Bias	1610	15	525	32.6
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	1610	15	451	28.0
Non-compliant holding time	Representativeness	1610	35	1226	76.1

As shown in the table above for major data quality issues, 34 Saturated Hydrocarbon results were rejected due to holding time. Holding times that resulted in major data quality issues (rejected) were extracted or analyzed 2X outside of the holding time.

Semivolatile Organic Compounds - Selective Ion Monitoring (SIM)

The SQT porewater SVOC SIM dataset is comprised of 32 samples with 1216 associated results, sediment SVOC SIM dataset is comprised of 46 samples with 1748 associated results, and tissue SVOC SIM dataset is comprised of 9 samples with 342 associated results.

No major data quality issues were identified during validation of the SQT SVOC SIM analyses.

Four minor data quality issues were identified during validation of the SQT SVOC SIM analyses. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
Semivolatile SIM Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of SVOC SIM Results Affected
Non-compliant field duplicate relative percent difference	Precision	1216	4	22	1.81
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	1216	1	12	0.99
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	1216	20	212	17.4
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1216	1	7	0.58

Minor Data Quality Issues					
Semivolatile SIM Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of SVOC SIM Results Affected
Non-compliant field duplicate relative percent difference	Precision	1748	6	108	6.18
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	1748	3	29	1.66
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	1748	28	360	20.6
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1748	3	64	3.66

Minor Data Quality Issues					
Semivolatile SIM Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of SVOC SIM Results Affected
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	342	2	24	7.02

Metals (including SEM)

The SQT porewater Metals dataset is comprised of 31 samples with 682 associated results, sediment Metals dataset is comprised of 46 samples with 1288 associated results, and tissue Metals dataset is comprised of 9 samples with 198 associated results. A total of five sediment sample results

from the Metals analyses were rejected due to laboratory duplicate relative percent difference, serial dilution, and matrix spike/matrix spike duplicate recovery.

Three major data quality issues were identified during validation of the SQT Metals analyses. The identified major data quality issues are described in the table below.

Nine minor data quality issues were identified during validation of the SQT Metals analyses. The identified minor data quality issues are described in the tables below.

Major Data Quality Issues					
Metals Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Metals Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	1288	1	1	0.08
Non-compliant serial dilution	Overall Accuracy/Bias	1288	1	1	0.08
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1288	3	3	0.23

Minor Data Quality Issues					
Metals Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Metals Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	682	2	4	0.59
Non-compliant field duplicate relative percent difference	Precision	682	4	22	3.23
Field blank contamination	Accuracy/Bias Contamination	682	1	1	0.15
Continuing calibration blank contamination	Accuracy/Bias Contamination	682	25	28	4.11
Non-compliant serial dilution	Overall Accuracy/Bias	682	2	4	0.59
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	682	2	6	0.88

Minor Data Quality Issues					
Metals Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Metals Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	1288	4	8	0.62
Non-compliant field duplicate relative percent difference	Precision	1288	4	8	0.62
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	1288	5	9	0.70
Continuing calibration blank contamination	Accuracy/Bias Contamination	1288	2	2	0.16
Non-compliant percent moisture	Overall Accuracy/Bias	1288	27	594	46.1
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1288	5	21	1.63
Non-compliant serial dilution	Overall Accuracy/Bias	1288	5	31	2.41
Non-compliant laboratory control sample	Overall Accuracy/Bias	1288	36	36	2.80

Minor Data Quality Issues					
Metals Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Metals Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	198	1	1	0.51
Non-compliant field duplicate relative percent difference	Precision	198	2	4	2.02
Continuing calibration blank contamination	Accuracy/Bias Contamination	198	9	12	6.06
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	198	1	3	1.52

As shown in the table above for major data quality issues, five Metals results were rejected due to laboratory duplicate relative percent difference, serial dilution, and matrix spike/matrix spike duplicate recovery. Laboratory duplicate relative percent difference that resulted in major data quality issues (rejected) were recoveries greater than 120% recovery. Serial dilutions that also resulted in major data quality issues (rejected) were recoveries greater than 120% recovery. Matrix spike/matrix spike duplicates that also resulted in major data quality issues (rejected) were recoveries below 30% with the associated result not detected.

Titanium

The SQT porewater Titanium dataset is comprised of 31 samples with 31 associated results, sediment Titanium dataset is comprised of 46 samples with 46 associated results, and tissue Titanium dataset is comprised of 9 samples with 9 associated results.

No major data quality issues were identified during validation of the SQT Titanium analyses.

Six minor data quality issues were identified during validation of the SQT Titanium analyses. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
Titanium Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Titanium Results Affected
Non-compliant field duplicate relative percent difference	Precision	31	2	2	6.45
Non-compliant laboratory duplicate relative percent difference	Precision	31	1	1	3.23
Continuing calibration blank contamination	Accuracy/Bias Contamination	31	8	8	25.8
Non-compliant serial dilution	Overall Accuracy/Bias	31	2	2	6.45

Minor Data Quality Issues					
Titanium Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Titanium Results Affected
Non-compliant percent moisture	Overall Accuracy/Bias	46	25	25	54.3
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	4	4	8.70

Minor Data Quality Issues					
Titanium Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Titanium Results Affected
Continuing calibration blank contamination	Accuracy/Bias Contamination	9	4	4	44.4

Mercury

The SQT porewater mercury dataset is comprised of 32 samples with 32 associated results, sediment mercury dataset is comprised of 46 samples with 46 associated results, and tissue mercury dataset is comprised of 9 samples with 9 associated results.

No major data quality issues were identified during validation of the SQT mercury analyses.

Three minor data quality issues were identified during validation of the SQT mercury analyses. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
Mercury Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Mercury Results Affected
Non-compliant field duplicate relative percent difference	Precision	32	4	4	12.5

Minor Data Quality Issues					
Mercury Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Mercury Results Affected
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/ Bias	46	2	2	4.35
Non-compliant holding time	Representativeness	46	46	46	100

Methylmercury

The SQT porewater methylmercury dataset is comprised of 32 samples with 32 associated results, sediment methylmercury dataset is comprised of 46 samples with 46 associated results, and tissue methylmercury dataset is comprised of 9 samples with 9 associated results.

No major data quality issues were identified during validation of the SQT methylmercury analyses.

Five minor data quality issues were identified during validation of the SQT methylmercury analyses. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
Methylmercury Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Methyl mercury Results Affected
Non-compliant field duplicate relative percent difference	Precision	32	2	2	6.25
Non-compliant holding time	Representativeness	32	32	32	100

Minor Data Quality Issues					
Methylmercury Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Methylmercury Results Affected
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	1	1	2.17
Non-compliant holding time	Representativeness	46	43	43	93.5

Minor Data Quality Issues					
Methylmercury Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Methylmercury Results Affected
Laboratory blank contamination	Accuracy/Bias Contamination	9	8	8	88.9

Cyanide

The SQT sediment Cyanide dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT Cyanide analyses.

Three minor data quality issues were identified in the SQT sediment Cyanide dataset. The identified minor data quality issues are described in the table below.

Minor Data Quality Issues					
Cyanide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Cyanide Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	1	1	2.17
Non-compliant percent moisture	Overall Accuracy/Bias	46	27	27	56.3

Hexavalent Chromium

The SQT sediment Hexavalent Chromium dataset is comprised of 46 samples with 46 associated results. A total of three sediment sample results from the Hexavalent Chromium analyses were rejected due to matrix spike/matrix spike duplicate recoveries.

One major data quality issue was identified during validation of the SQT Hexavalent Chromium analyses. The identified major data quality issue is described in the table below.

No minor data quality issues were identified in the SQT sediment Hexavalent Chromium dataset.

Major Data Quality Issues					
Hexavalent Chromium Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Hexavalent Chromium Results Affected
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	3	3	6.52

As shown in the table above for major data quality issues, three Hexavalent Chromium results were rejected due to matrix spike/matrix spike duplicate recoveries. Matrix spike/matrix spike duplicate recoveries that resulted in major data quality issues (rejected) were recoveries below 50% recovery.

Sulfide

The SQT porewater Sulfide dataset is comprised of 32 samples with 32 associated results and sediment Sulfide dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT Sulfide analyses.

One minor data quality issue was identified in the SQT sediment Sulfide dataset. The identified minor data quality issue is described in the table below.

Minor Data Quality Issues					
Sulfide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Sulfide Results Affected
Non-compliant field duplicate relative percent difference	Precision	46	2	2	4.35

Polychlorinated Dibenzo-p-dioxins/Polychlorinated Dibenzofurans (PCDDs/PCDFs)

The SQT porewater PCDDs/PCDFs dataset is comprised of 32 samples with 544 associated results, sediment PCDDs/PCDFs dataset is comprised of 46 samples with 782 associated results, and tissue PCDDs/PCDFs dataset is comprised of 9 samples with 153 associated results.

No major data quality issues were identified during validation of the SQT PCDD/PCDF analyses.

Seven minor data quality issues were identified in the SQT PCDD/PCDF datasets. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
PCDDs/PCDFs Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCDD/PCDF Results Affected
Method blank contamination	Accuracy/Bias Contamination	544	1	1	0.18
Non-compliant sample ion ratio	Overall Accuracy/Bias	544	13	14	2.57

Minor Data Quality Issues					
PCDDs/PCDFs Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCDD/PCDF Results Affected
Non-compliant field duplicate relative percent difference	Precision	782	4	4	0.51
Field blank contamination	Accuracy/Bias Contamination	782	3	5	0.64
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	782	3	8	1.02
Non-compliant sample ion ratio	Overall Accuracy/Bias	782	3	3	0.38
Non-compliant percent moisture	Overall Accuracy/Bias	782	27	459	58.7
Non-compliant holding time	Representativeness	782	28	476	60.9

Minor Data Quality Issues					
PCDDs/PCDFs Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCDD/PCDF Results Affected
Non-compliant field duplicate relative percent difference	Precision	153	2	5	3.27
Non-compliant sample ion ratio	Overall Accuracy/Bias	153	1	1	0.65

Polychlorinated Biphenyl Congeners

The SQT porewater PCB Congener dataset is comprised of 32 samples with 5376 associated results, sediment PCB Congener dataset is comprised of 46 samples with 7728 associated results, and tissue PCB Congener dataset is comprised of 9 samples with 1512 associated results. A total of 83 porewater

sample results from the PCB Congener analyses were rejected due to continuing calibration retention times. A total of 435 sediment sample results from the PCB Congener analyses were rejected due to continuing calibration retention times and ion abundance ratios. A total of 62 tissue sample results from the PCB Congener analyses were rejected due to continuing calibration retention times.

Two major data quality issues were identified during validation of the SQT PCB Congener analyses. The identified major quality issues are described in the tables below.

Eight minor data quality issues were identified during validation of the SQT PCB Congener analyses. The identified minor data quality issues are described in the tables below.

Major Data Quality Issues					
PCB Congeners Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Non-compliant continuing calibration relative retention times	Overall Accuracy/Bias	5376	14	83	1.54

Major Data Quality Issues					
PCB Congeners Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Non-compliant continuing calibration relative retention times	Overall Accuracy/Bias	7728	44	426	5.51
Non-compliant initial calibration ion abundance ratio	Overall Accuracy/Bias	7728	9	9	0.12

Major Data Quality Issues					
PCB Congeners Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Non-compliant continuing calibration relative retention times	Overall Accuracy/Bias	1512	9	62	4.10

Minor Data Quality Issues					
PCB Congeners Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Non-compliant field duplicate relative percent difference	Precision	5376	4	174	3.24

Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	5376	2	102	1.90
Non-compliant project specific labeled analog recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	5376	1	1	0.02

Minor Data Quality Issues					
PCB Congeners Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Non-compliant field duplicate relative percent difference	Precision	7728	6	234	3.03
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	7728	3	23	0.30
Laboratory blank contamination	Accuracy/Bias Contamination	7728	18	36	0.47
Non-compliant percent moisture	Overall Accuracy/Bias	7728	26	4368	56.5
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	7728	3	292	3.78
Non-compliant project specific labeled analog recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	7728	7	12	0.16
Non-compliant holding time	Representativeness	7728	28	4704	60.9

Minor Data Quality Issues					
PCB Congeners Tissue	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of PCB Congener Results Affected
Laboratory blank contamination	Accuracy/Bias Contamination	1512	2	3	0.20
Non-compliant sample ion abundance ratio	Overall Accuracy/Bias	1512	2	2	0.13
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	1512	1	10	0.66

Chlorinated Herbicides

The SQT sediment Chlorinated Herbicide dataset is comprised of 46 samples with 184 associated results. A total of two sediment sample results from the Chlorinated Herbicide analyses were rejected due to herbicide identification percent difference.

One major data quality issue was identified during validation of the SQT Chlorinated Herbicide analyses. The identified major data quality issue is described in the table below.

Three minor data quality issues were identified in the SQT sediment Chlorinated Herbicide dataset. The identified minor data quality issues are described in the table below.

Major Data Quality Issues					
Chlorinated Herbicide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Chlorinated Herbicide Results Affected
Non-compliant Herbicide identification analysis percent difference	Precision	184	2	2	1.09

Minor Data Quality Issues					
Chlorinated Herbicide Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Chlorinated Herbicide Results Affected
Non-compliant Herbicide identification analysis percent difference	Precision	184	8	8	4.35
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	184	3	12	6.52
Non-compliant percent moisture	Overall Accuracy/Bias	184	27	108	58.7

As shown in the table above for major data quality issues, two Chlorinated Herbicide results were rejected due to herbicide identification percent difference. Herbicide identification percent difference that resulted in major data quality issues (rejected) were percent differences greater than 90%.

Dissolved Organic Carbon (DOC)/Total Organic Carbon (TOC)

The SQT porewater DOC dataset is comprised of 30 samples with 30 associated results and sediment TOC dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT DOC/TOC analyses.

Four minor data quality issues were identified in the SQT DOC/TOC dataset. The identified minor data quality issues are described in the tables below.

Minor Data Quality Issues					
DOC Porewater	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of DOC Results Affected
Field blank contamination	Accuracy/Bias Contamination	30	9	9	30.0
Non-compliant holding time	Representativeness	30	12	12	40.0

Minor Data Quality Issues					
TOC Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of TOC Results Affected
Non-compliant field duplicate relative percent difference	Precision	46	4	4	8.70
Non-compliant laboratory control sample	Overall Accuracy/Bias	46	21	21	45.7
Non-compliant holding time	Representativeness	46	9	9	19.6

Oxidation Reduction Potential (ORP)

The SQT sediment ORP dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT ORP analyses.

One minor data quality issue was identified in the SQT sediment ORP dataset. The identified minor data quality issue is described in the table below.

Minor Data Quality Issues					
ORP Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of ORP Results Affected
Non-compliant holding time	Representativeness	46	4	4	8.70

Total Extractable Petroleum Hydrocarbon (TEPH)

The SQT sediment TEPH dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT TEPH analyses.

One minor data quality issue was identified in the SQT sediment TEPH dataset. The identified minor data quality issue is described in the table below.

Minor Data Quality Issues					
TEPH Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of TEPH Results Affected
Non-compliant project specific surrogate recovery, as specified by USEPA Region 2	Overall Accuracy/Bias	46	2	2	4.35

Total Phosphorus

The SQT sediment Total Phosphorus dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT Total Phosphorus analyses.

Three minor data quality issues were identified in the SQT sediment Total Phosphorus dataset. The identified minor data quality issues are described in the table below.

Minor Data Quality Issues					
Total Phosphorus Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of Total Phosphorus Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	3	3	6.52

Acid Volatile Sulfide (AVS)

The SQT sediment AVS dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT AVS analyses.

Three minor data quality issues were identified in the SQT sediment AVS dataset. The identified minor data quality issues are described in the table below.

Minor Data Quality Issues					
AVS Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of AVS Results Affected
Non-compliant laboratory duplicate relative percent difference	Precision	46	1	1	2.17
Non-compliant matrix spike/matrix spike duplicate relative percent difference	Precision	46	3	3	6.52
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	1	1	2.17

Total Kjeldahl Nitrogen (TKN)

The SQT sediment TKN dataset is comprised of 46 samples with 46 associated results.

No major data quality issues were identified during validation of the SQT TKN analyses.

One minor data quality issue was identified in the SQT sediment TKN dataset. The identified minor data quality issue is described in the table below.

Minor Data Quality Issues					
TKN Sediment	Data Quality Parameter Affected	Total Number of Results Reported	Number of Samples Affected	Number of Results Affected	% of TKN Results Affected
Non-compliant matrix spike/matrix spike duplicate recovery	Overall Accuracy/Bias	46	1	1	2.17

Ammonia Nitrogen

The SQT porewater Ammonia Nitrogen dataset is comprised of 30 samples with 30 associated results and sediment Ammonia Nitrogen dataset is comprised of 46 samples with 46 associated results.

No major or minor data quality issues were identified during validation of the SQT Ammonia Nitrogen analyses.

pH

The SQT sediment pH dataset is comprised of 46 samples with 46 associated results.

No major or minor data quality issues were identified during validation of the SQT pH analyses.

Geotechnical

The SQT sediment grain size dataset is comprised of 46 samples with 782 associated results.

No major or minor data quality issues were identified during the verification of the SQT grain size analyses.

Bioaccumulation Testing

The SQT tissue data set is comprised of 9 samples (8 samples plus one duplicate sample) with 9 associated results.

Data verification was performed on the bioaccumulation testing and no data quality issues were identified. For bioaccumulation testing results, refer to the report in Appendix A, including the discussion on precision.

Percent Lipid

The SQT tissue percent lipid dataset is comprised of 9 samples with 9 associated results.

No major or minor data quality issues were identified during the verification of the SQT percent lipid analyses.

Percent Moisture

The SQT sediment percent moisture dataset is comprised of 46 samples with 46 associated results and tissue percent moisture dataset is comprised of 9 samples with 9 associated results.

No major or minor data quality issues were identified during the verification of the SQT percent moisture analyses.

4.0 CONCLUSIONS

The data usability evaluations outlined in this report provide details regarding the relationship of data quality issues to associated samples and sample results. Ninety-six percent (96%) of the data validated and reported are suitable for their intended use. A total of 407 sample results for the SVOC analyses were rejected due to holding time violations. A total of 95 sample results for the organochlorine pesticide analyses were rejected due to surrogate recoveries. A total of 34 sample results for the saturated hydrocarbon analyses were rejected due to holding time violations. A total of five sample results for the metals analyses were rejected due to spike sample recoveries, serial dilution, and laboratory duplicate sample relative percent difference. A total of three sample results for the hexavalent chromium analyses were rejected due to spike sample recoveries. A total of 580 sample results for the PCB congener analyses were rejected due to continuing calibration relative retention times and initial calibration ion abundance ratios. A total of two samples results for the chlorinated herbicides analyses were rejected due to identification analysis percent difference. Sample results that were rejected are not suitable for project use. Sample results that are qualified as estimated due to multiple minor data quality issues as detailed in this report are suitable for project use. The achievement of the completeness goals for number of samples collected and the number of samples accepted for use provides sufficient quality data to support project decisions.

Appendix I

Threshold values for each metric are based on the NY/NJ B-IBI presented in Weisberg et al. (1998).

Table 6. Thresholds used to score each metric of the NY-NJ Harbor B-IBI

	Scoring Criteria		
	5	3	1
Number of Species			
Polyhaline Sand	> 20	15 - 20	< 15
Polyhaline Mud	> 20	15 - 20	< 15
Euhaline Sand	> 25	15 - 25	< 15
Euhaline Mud	> 25	15 - 25	< 15
Abundance (#/m²)			
Polyhaline Sand	2,500 - 10,000	1,000 - 2,500	< 1,000
		or 10,000 - 25,000	or > 25,000
Polyhaline Mud	3,000 - 10,000	1,500 - 3,000	< 1,500
		or 10,000 - 20,000	or > 20,000
Euhaline Sand	3,000 - 10,000	1,500 - 3,000	< 1,500
		or 10,000 - 50,000	or > 30,000
Euhaline Mud	3,500 - 10,000	2,000 - 3,500	< 2,000
		or 10,000 - 25,000	or > 25,000
Biomass			
Polyhaline Sand	2 - 8	0.8 - 2 or > 8	< 0.8
Polyhaline Mud	3 - 10	1 - 3 or > 10	< 1
Euhaline Sand	2 - 10	0.8 - 2 or > 10	< 0.8
Euhaline Mud	4 - 10	1 - 4 or > 10	< 1
Abundance of Pollution-Indicative Taxa (%)			
Polyhaline Sand	< 10	10 - 40	> 40
Polyhaline Mud	< 10	10 - 40	> 40
Euhaline Sand	< 10	10 - 40	> 40
Euhaline Mud	< 10	10 - 40	> 40

Table 6. Continued

	Scoring Criteria		
	5	3	1
Abundance of Pollution-Sensitive Taxa (%)			
Polyhaline Sand	> 15	3 - 15	< 3
Polyhaline Mud	> 15	3 - 15	< 3
Euhaline Sand	> 15	3 - 15	< 3
Euhaline Mud	> 10	2 - 10	< 2
Abundance of Carnivores/Omnivores (%)			
Polyhaline Sand	> 15	3 - 15	< 3
Polyhaline Mud	> 15	4 - 15	< 4
Euhaline Sand	> 10	2 - 10	< 2
Euhaline Mud	> 10	3 - 10	< 3
